A full data validation was performed on the analytical data for twenty-four sediment samples collected on June 14, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOCs	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Several SVOC compounds were rejected in ten samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Semivolatile Organic Compounds (SVOCs)

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-two sediment samples collected on June 15, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOC	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;

- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in thirteen samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-one sediment samples collected on June 15 and 18, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOCs	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in seven samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Data Qualifiers

U	=	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.
UJ	=	The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.
J	=	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).
J+	=	The result is an estimated quantity, but the result may be biased high.
J-	=	The result is an estimated quantity, but the result may be biased low.
R	=	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
NJ	=	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-four sediment samples collected on June 17, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;

- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in nine samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-three sediment samples collected on June 15, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in seven samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-two sediment samples collected on June 16-17, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan

for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in three samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-seven sediment samples collected on June 17, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in eleven samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-four sediment samples collected on June 17-18, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in three samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Data Qualifiers

U	=	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.
UJ	=	The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.
J	=	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).
J+	=	The result is an estimated quantity, but the result may be biased high.
J-	=	The result is an estimated quantity, but the result may be biased low.
R	=	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
NJ	=	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-three sediment samples collected on June 18-19, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOCs	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in seven samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-two sediment samples collected on June 19, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOC	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in eight samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-two sediment samples collected on June 19, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOC	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in one sample due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Semivolatile Organic Compounds (SVOC)

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-one sediment samples collected on June 19-20, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOC	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in fourteen samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Data Qualifiers

U	=	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.
UJ	=	The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.
J	=	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).
J+	=	The result is an estimated quantity, but the result may be biased high.
J-	=	The result is an estimated quantity, but the result may be biased low.
R	=	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
NJ	=	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
