EXECUTIVE SUMMARY

This report presents the contaminated sediments site characterization for the Phase 2 Lower Maumee River Site (the Site), located within the Maumee Area of Concern (AOC), Toledo, Ohio (Figure ES-1). This work was conducted by EA Engineering, Science, and Technology, Inc. (EA) and the U.S. Environmental Protection Agency's (EPA) Great Lakes National Program Office (GLNPO) in accordance with the Quality Assurance Project Plan (QAPP) and Field Sampling Plan (FSP) for Phase 2 of the Lower Maumee River Site Characterization, Maumee River AOC, Toledo, Ohio (EA 2013a, b), finalized May 2013. The purpose of the field investigation was to determine the nature and extent of chemical contamination in the areas of soft sediment deposition. Primary objectives were to determine the approximate depth of contamination, provide information about depositional areas, and identify priority areas for remediation or for further investigation in the Phase 2 area of the Lower Maumee River. This site characterization report summarizes the findings from the field investigation and and includes data tables and figures, data comparisons to sediment benchmarks, and spatial analysis and data interpolation to identify primary areas for remediation. The results of this Phase 2 site characterization, as well as the results from the Phase 1 Maumee River Sediment Assessment (Weston 2012b) and from the Duck and Otter Creeks Sediment Assessment (Weston 2012a) site characterizations, were evaluated collectively to assess the overall sediment quality for the Lower Maumee River area.

E.1 SITE BACKGROUND

The Maumee River has a drainage area of 8,316 square miles, the largest of the Great Lakes rivers, and flows 130 miles from its headwaters in Fort Wayne, Indiana, to its mouth at Lake Erie in Toledo, Ohio. The Phase 2 Lower Maumee River Site Characterization took place in the lower-most reaches of the Maumee River, from the U.S. Route 280 bridge downstream to the southern coast of Grassy Island; approximately 4.6 miles (Figure ES-2). It is believed that contaminated sediments in the study area contribute to beneficial use impairments in the AOC.

The Lower Maumee River is an industrialized port with historical contamination due to industrial and commercial land use. Contamination sources include various coal industries, chemical plants, petroleum production, and wastewater outfalls. Sampling and testing by Ohio EPA and City of Toledo (Ohio EPA 1990), along with sediment investigations performed by GLNPO (AScI 1997; Weston 2012a; Weston 2012b), indicated elevated concentrations of polychlorinated biphenyls (PCBs), polycyclic aromatic hydrocarbons (PAHs), and heavy metals in surface sediments of the project area. To build on these existing historical studies and to clearly define the nature and extent of sediment contamination within the project area, additional sampling and chemical and physical analyses were undertaken during the Phase 2 investigation.

E.2 METHODOLOGY

This section provides the methodology for the incorporation of sediment chemistry data from previous sediment assessments conducted in the Lower Maumee River (LMR), as well as the methodology for the Phase 2 field effort.

Incorporation of Previous Sediment Data from the Maumee AOC

The results of two previous sediment investigations conducted by GLNPO in the Maumee AOC were used in conjunction with the results from the Phase 2 field effort to develop this site characterization report. The previous studies used were: (1) The AScI Sediment Quality Assessment for the Maumee River AOC (AScI 1997), and (2) The Duck and Otter Creeks Sediment Assessment (Weston 2012a). GLNPO conducted a sediment assessment in the Phase 1 area of the Lower Maumee River; however, because there were no distinct horizontal or vertical trends in the contamination found in the Phase 1 area, the sediment chemistry data collected during the Phase 1 effort were not incorporated/combined with the Phase 2 data, or with data from the other previous studies. The general findings from the Phase 1 study were used, in conjunction with the modeling of constituent of concern (COC) concentrations from the Phase 2 study and other studies, to help draw conclusions about the overall sediment quality within the LMR.

The 1997 sediment assessment identified three prominent hot spot areas with elevated concentrations of these constituents: (1) the area immediately adjacent to the eastern side of the sway bridge that is located north of the U.S. Route 280 bridge; (2) the wastewater treatment plant (WWTP) facility located on the western bank of the river approximately 1.5 miles downstream of the sway bridge; and (3) the outermost area of the Duck Creek confluence near the mouth of the Maumee River (Figure ES-3).

Sediment chemistry data from both surface and subsurface samples from the AScI and Duck and Otter Creeks reports were combined electronically with the Phase 2 analytical results. Figures were produced that present the COC distribution in the Maumee AOC using both the data from the previous studies and the Phase 2 investigation.

Phase 2 Site Investigation

The purpose of the Phase 2 site investigation was to collect chemical and physical information for the Maumee River downstream of the U.S. Route 280 bridge to determine the extent of chemical contamination in both surface and subsurface sediments, to provide information about depositional areas, and to identify priority areas for remediation or for further investigation. A total of 90 locations were successfully sampled using a vibracoring system and direct push corer. One core was collected from each location for physical and chemical analysis. The Phase 2 area was divided into three separate areas for sampling. Area A extends from the Grassy Island in Maumee Harbor upstream to the river area adjacent to the Toledo Yacht Club (Figure ES-4A), and is comprised of the cove west of the Grassy Island and the main river channel excluding the federal navigation channel. Area B extends from the Toledo Yacht Club upstream to the river area adjacent to the southernmost sway bridge (Figure ES-4B). Area C extends from the sway bridge upstream to the U.S. Route 280 bridge (Figure ES-4C).

A total of 359 sediment samples were collected from 90 sample locations. At 76 of the 90 sample locations, sediment samples were collected using a vibracoring system onboard the GLNPO sampling vessel *R/V Mudpuppy II*. Fourteen locations in the cove west of Grassy Island

were sampled by Ohio EPA using direct push coring from a small jon boat that could navigate the shallow depths. A global positioning system (GPS) with sub-meter accuracy was used to navigate to each location. Samples were collected from the following intervals: 0 to 12 inches (in.), 12 to 24 in., and every 24 in. thereafter [24 to 48 in., 48 to 72 in., etc.] to the end of each core. Sediment from each depth interval was homogenized prior to separation into individual containers for submittal to the laboratory for analysis.

Each sediment sample underwent the following analyses: PCBs – aroclors, total organic carbon (TOC), semivolatile organic compounds (SVOCs), oil and grease, total metals (arsenic, cadmium, chromium, copper, lead, nickel, zinc), and total mercury. In addition, based on a preliminary review of the PCB aroclor data, 10 percent of samples were selected and submitted for analysis of PCB congeners.

Sediment samples from the 0 to 1 foot (ft) interval were analyzed for: 34 PAHs (approximately 10 percent of total samples), acid volatile sulfide (AVS)/simultaneously extracted metals (SEM) (approximately 10 percent of total samples), grain size, and bulk density. These analyses were performed on surface sediment because the data they yield are useful for assessing toxicity to organisms that typically contact only the surface sediments.

Forty-four (44) locations were selected for the analysis of 34 PAHs and AVS/SEM; comprised of every other location sampled for the first 70 locations (35 samples) plus 9 judgmental sampling locations at the surface only. Additionally, following receipt and review of the preliminary results of the PCB aroclor results, EA and EPA collaborated to select 36 samples (10% of total samples) (based on highest total PCB concentrations) to be extracted and analyzed for PCB congeners.

Sample handling, chain-of-custody procedure, and quality assurance/quality control procedures were conducted in accordance with the procedures outlined in the FSP (EA 2013b). Sample labeling was performed in accordance with standard operating procedure (SOP) 001 (Appendix B of the QAPP [EA 2013a]). Individual sample containers were labeled with a unique designation that corresponded to the specific geographic location, year of collection, and subsample depth interval. Decontamination procedures were carried out in accordance with Appendix A of the QAPP (EA 2013a). Following collection of the sediment samples, investigation-derived waste was managed in accordance with the procedures described in Appendix A of the QAPP (EA 2013a).

E.3 SEDIMENT CHEMISTRY RESULTS

Lithology

The sediment cores collected within the Phase 2 Lower Maumee River site demonstrate a mixture of core profiles containing sediment types consistent with a fluvial system. Most cores were characterized by thick layers of silty clay overlain by a thin layer of silt. Native and non-native material—such as shells, creosote/diesel odor, and creosote-soaked woody debris—were frequently observed within various sediment types and depths.

Bulk Chemistry

The sediment chemistry results of the Phase 2 sediment samples were compared to TEC and PEC levels (Macdonald et al. 2000) and Sediment Reference Values (SRVs) (for metals only) (Ohio EPA 2008). In general, the highest concentrations of constituents were co-located in the areas of the WWTP, the sway bridge, and the outermost area of the Duck Creek confluence (Figure ES-3). The highest oil and grease concentrations were detected at locations close to the WWTP and the sway bridge areas. Total PCB concentrations were highest at location LMR13-46 with elevated concentrations also detected at locations LMR13-43, -45, and -93 near the WWTP, and at locations LMR13-63 and LMR13-91 near the outermost area of the Duck Creek confluence. For most samples from these locations, total PCB concentrations increased with depth. In the areas where total PCB concentrations exceeded the PEC, several individual aroclors appear to be predominant. Of the nine aroclors analyzed, aroclor 1242, aroclor 1254, and aroclor 1248 had the highest concentrations near both the WWTP and the Duck Creek confluence area. Concentrations of 17PAHs were highest at locations LMR13-87, -88, -94, and -95; with concentrations exceeding the PEC at most depth intervals. Of the 17 PAHs analyzed, anthracene, chrysene, fluoranthene, naphthalene, phenanthrene, and pyrene had the highest concentrations near the sway bridge area, and appear to be predominant. 34PAHs were measured in surface samples, and the highest concentration was detected at sample location LMR13-95. Other locations with elevated 34PAH concentrations were LMR13-55, -57, -88, and -94. The highest concentrations of each individual metal were found at sample locations LMR13-54 and LMR13-55 near the sway bridge area and/or at sample locations LMR13-43, -45, and -46 near the WWTP. The predominant metals within the Phase 2 area were cadmium, chromium, lead, and zinc.

E.4 SPATIAL ANALYSIS

To further define the hot spot areas within the Maumee AOC, analytes with concentrations exceeding their respective PEC in Phase 2 sediment samples were spatially interpolated using kriging to develop an estimate of the concentration and distribution of constituents across the study area. Determination of hot spots will allow priority areas to be targeted for remediation.

The kriging analysis identified several hot spots within the Phase 2 study area, where one or more analytes were present in concentrations exceeding the PEC at two or more adjacent locations. These hot spots were defined as either major impact hot spots or moderate impact hot spots. Major impact hot spots were defined as areas having concentrations of at least one constituent exceeding three times the PEC at a minimum of two adjacent sample locations. These areas have the largest estimated volumes of sediment with COCs exceeding the PEC. Moderate impact hot spot areas have less elevated constituent concentrations and smaller estimated sediment volumes exceeding the PEC.

Based on the interpolation results, three major impact hot spot areas are identified: (1) the Duck Creek confluence area; (2) the WWTP; and (3) the sway bridge area. The primary COCs, with concentrations exceeding three times the PEC in these areas, are total PCBs, total 17PAHs, and several metals (cadmium, chromium, nickel, lead, and zinc). There are 21 smaller areas with

measured concentrations of one or more constituents above the PECs; however, 15 of these smaller areas are not considered moderate impact hot spots as they have only a single sample with a constituent concentration elevated slightly above the PEC, and thus much smaller estimated volumes of contaminated sediments than the three major hot spot areas. The other six smaller areas are considered moderate impact hot spots; these areas either had concentrations of at least one constituent that exceeded the PEC by more than two times or were located in close proximity to one of the three major hot spot areas (Figures ES-5A, ES-5B, and ES-5C).

The major impact hot spots were discussed in further detail and were evaluated in conjunction with historical sediment data and with data on depth of impacted material below the sediment surface, as determined by the Phase 2 kriging analysis (Figures ES-6, ES-7, and ES-8).

When evaluated together, the Phase 2 sediment data, the historical sediment data, and the Phase 2 data modeled at depth identify the following three major impact hot spots:

- **Duck Creek confluence area**—Maximum total PCB concentrations in the Duck Creek hot spot exceeded three times the PEC for total PCBs; and nickel concentrations exceeded the PEC at LMR13-91. Evaluation of historical and recent data suggests that total PCB concentrations within the lower portion of Duck Creek have been elevated more than three times above the PEC since 1995, and that concentrations exceeding three times the PEC continue into the immediate confluence area at the discharge point, and into the outermost confluence area toward the river channel (Figure ES-6).

- **WWTP area**—The main COCs for the WWTP hot spot area were total PCBs and metals. Total PCB concentrations exceeded three times the PEC for all locations except for LMR13-81. Total 17PAHs and five metals each had at least one concentration exceeding the respective PEC, or two times the PEC. Evaluation of historical and recent data suggests that total PCB and metal concentrations within the WWTP hot spot have been elevated above the PEC since 1995, and that concentrations exceeding three times the PEC are present throughout the sediment profile. This suggests intervals of burial and deposition of contaminated sediments over the past 20 years (Figure ES-7).

- **Sway bridge area**—Total 17PAH concentrations exceeded three times the PEC in all samples from all locations with the exception of LMR13-86. Each Phase 2 sample location had at least one sample with a zinc concentration exceeding the respective PEC in the sway bridge hot spot; concentrations of five other metals also exceeded their PECs at this hot spot (arsenic, lead, mercury, nickel, and zinc). Evaluation of historical and recent data suggests that constituent concentrations within the sway bridge hot spot are fairly evenly distributed throughout the sediment profile, and that total 17PAH is the primary constituent at this hot spot. It is unclear whether or not historical PAH contamination existed at the sway bridge hot spot; the PAH data collected in the 1995 study were considered unreliable and were not used to assess sediment quality for that investigation (Figure ES-8).

E.5 CONCLUSIONS

Based on the data collected during the Phase 2 sediment assessment in the LMR, the major areas of concern for sediment contamination are the Duck Creek confluence area, the WWTP, and the sway bridge area. The following conclusions can be drawn for these hot spot areas:

- These three major hot spots have an estimated total of approximately 666,000 cubic yards (cy) of sediment with constituent concentrations greater than the PEC. Previous sediment investigations also found high concentrations of constituents located in these areas (AScI 1997; Weston 2012b).

- When evaluating both Phase 2 sediment data and historical sediment data together, it is evident that elevated concentrations of constituents in sediments at these hot spots have been present for several decades, and that burial of elevated concentrations has occurred to some degree at each of the three areas.

    - Both recent data from the Weston study and historical data from the AScI study show that the Duck Creek confluence hot spot has elevated total PCB concentrations that begin in the lower part of the creek itself and continue into the immediate confluence area.

    - Data from both the WWTP and sway bridge hotspots show burial of concentrations of constituents exceeding three times the PEC, as well as some surface deposits with elevated concentrations.

    - Sediment from both the WWTP and sway bridge hot spots had high concentrations of several metals with concentrations exceeding two and three times the PEC; however, the primary COCs for these areas are total PCBs and total 17PAHs due to both frequency and level of exceedance.

- There are several moderate impact hot spot areas that demonstrated concentrations of one or more constituents above PECs. The majority of these locations contained only a single sample with a constituent concentration elevated slightly above the PEC, or had less than half the volume of contaminated sediment as compared to the three major hot spot areas (Figures 5-1A through 5-1C). As a result, the majority of these areas are not considered indicative of hot spots warranting priority remediation.

1. INTRODUCTION

This report presents the contaminated sediments site characterization for the Phase 2 Lower Maumee River Site (the Site), located within the Maumee Area of Concern (AOC), Toledo, Ohio (Figure 1-1). This work was conducted by EA Engineering, Science, and Technology, Inc. (EA) and the U.S. Environmental Protection Agency's (EPA) Great Lakes National Program Office (GLNPO) in accordance with the Quality Assurance Project Plan (QAPP) and Field Sampling Plan (FSP) for Phase 2 of the Lower Maumee River Site Characterization, Maumee River AOC, Toledo, Ohio (EA 2013a, b), finalized May 2013.

1.1 WORK SCOPE AND OBJECTIVES

1.1.1 Project Objectives

The purpose of the field investigation was to determine the nature and extent of chemical contamination in the areas of soft sediment deposition. Primary objectives were to determine the approximate depth of contamination, provide information about depositional areas, and identify priority areas for remediation or for further investigation in the Phase 2 area of the Lower Maumee River (LMR). Major impact hot spot areas were defined by using kriging analysis on the Phase 2 data; this analysis identified areas of the LMR with high constituent concentrations and high volumes of contaminated sediment, and defined moderate impact hot spot areas with less elevated constituent concentrations and smaller volumes. These major and moderate impact areas are referred to as hot spots throughout this document and are further discussed in Sections 5 and 6.

1.1.2 Objectives of the Site Characterization Report

This site characterization report summarizes the findings from the field investigation and includes data tables and figures, data comparisons to sediment benchmarks, and spatial analysis and data interpolation to identify primary areas for remediation. The results of this Phase 2 site characterization, as well as the results from the Phase 1 Maumee River Sediment Assessment (Weston 2012b) and from the Duck and Otter Creeks Sediment Assessment (Weston 2012a) site characterizations, were evaluated collectively to assess the overall sediment quality for the Lower Maumee River area. The overall objective of this report is to identify priority areas within the Maumee AOC at which remediation efforts should be initiated.

1.2 SITE LOCATION AND HISTORY

The Maumee River has a drainage area of 8,316 square miles, the largest of the Great Lakes rivers, and flows 130 miles from its headwaters in Fort Wayne, Indiana, to its mouth at Lake Erie in Toledo, Ohio. The Maumee AOC does not include the river in its entirety; rather, it includes the lower reach and tributaries, as well as some of the neighboring watersheds (Figure 1-1). The Phase 2 Lower Maumee River Site Characterization took place in the lower-most reaches of the Maumee River, from the U.S. Route 280 bridge downstream to the southern coast of Grassy Island, approximately 4.6 miles (Figure 1-2).

It is believed that contaminated sediments in the study area contribute to beneficial use impairments in the AOC. Impairment of beneficial use means a change in the chemical, physical, or biological integrity of the Great Lakes ecosystem. The Maumee River Remedial Action Plan (Ohio Environmental Protection Agency [Ohio EPA] 1990) identifies the following beneficial use impairments for the Maumee AOC:

- Restrictions on fish and wildlife consumption
- Eutrophication or undesirable algae
- Restrictions on drinking water consumption, or taste and odor
- Degradation of fish and wildlife populations
- Beach closings
- Fish tumors or other deformities
- Degradation of aesthetics
- Degradation of benthos
- Restriction on dredging activities
- Loss of fish and wildlife habitat.

The LMR is an industrialized port with historical contamination due to industrial and commercial land use. Contamination sources include various coal industries, chemical plants, petroleum production, and wastewater outfalls. Sampling and testing by Ohio EPA and City of Toledo indicated elevated concentrations of polychlorinated biphenyls (PCBs), polycyclic aromatic hydrocarbons (PAHs), and heavy metals in surface sediments of the project area (Ohio EPA 1990). These sediments adversely impact the survival and viability of benthic organisms and fish communities, while placing restrictions on dredging. The sediment contamination may also impact human health due to consumption of fish containing elevated levels of PCBs, and heavy metals. The Maumee River Public Advisory Council, in coordination with the State of Ohio, indicate in the Maumee River Remedial Action Plan that "heavy metals and organic chemical sediment contamination are what led to the lower Maumee River being classified as an Area of Concern"(Ohio EPA 1990).

In 1995-1996, AScI performed a sediment investigation in the Maumee River, Ottawa River, Swan Creek, Otter Creek, Duck Creek, and Maumee Bay. Five constituents (chromium, lead, nickel, zinc, and total PCBs) were present in elevated concentrations from three distinct areas within the LMR (AScI 1997). In 2010, GLNPO performed a sediment investigation of the Duck Creek and Otter Creek confluence areas (Figure 1-2) (Weston 2012a). The Duck Creek confluence area, which is adjacent to the Phase 2 Maumee project area, has high concentrations of PCBs below the sediment surface. The Otter Creek confluence area, which is also adjacent to the Phase 2 Maumee project area, has high concentrations of PAHs below the sediment surface. In 2011 and 2012, GLNPO performed a sediment assessment of the Phase 1 area of the Lower Maumee River (Figure 1-2). Results of that sampling event are presented in a Sediment Assessment Report, Lower Maumee River, Maumee Area of Concern, Toledo, Lucas County, Ohio (Weston 2012b). Sampling results indicated that PAHs and metals are of concern in a few

isolated parts of the Phase 1 project area. These historical studies are further described in Section 2.

To build on these existing historical studies and to clearly define the nature and extent of elevated constituent concentrations in sediment within the project area, additional sampling and chemical and physical analyses were undertaken during the Phase 2 investigation.

This page intentionally left blank

2. PREVIOUS INVESTIGATIONS

This section provides an overview of the previous sediment investigations conducted by GLNPO in the Maumee AOC that were used in conjunction with the results from the Phase 2 field effort to develop this site characterization report. Three previous studies were used: (1) The AScI Sediment Quality Assessment for the Maumee River AOC (AScI 1997); (2) The Duck and Otter Creeks Sediment Assessment (Weston 2012a); and (3) the Phase 1 Lower Maumee River Sediment Assessment (Weston 2012b).

2.1 ASCI SEDIMENT QUALITY ASSESSMENT FOR THE MAUMEE AOC

The AScI Corporation sediment assessment (conducted for GLNPO) for the Maumee AOC was performed in two field efforts, one during Spring 1995 and the other during Fall 1996. The objectives of the assessment were to investigate the distribution and magnitude of contamination in sediments from the Maumee AOC. Samples were collected from the LMR, Ottawa River, Swan Creek, Otter Creek, Duck Creek, and Maumee Bay (AScI 1997).

One hundred and forty-seven sediment cores were collected via Vibracore from the research vessel *R/V Mudpuppy*; these cores were divided into 338 samples that were submitted for analysis of metals, PCBs, and PAHs. The length of the cores varied among sampling area; cores collected from within the LMR and Duck Creek were a maximum of 66 inches (in.) in length. Table 2-1 presents the sampling scheme and analyses performed on samples collected during this effort. Screening analysis methods were used to measure the selected metals, total PCBs, and total PAHs; X-ray fluorescence was used to measure metals; and quantitative enzyme immunoassays were used to measure total PCBs and total PAHs (AScI 1997). A subset of the 338 samples was also analyzed for the same parameters using conventional laboratory techniques in order to investigate the reliability of the screening analysis methods (Table 2-1). Constituent concentrations were compared to two sets of sediment quality guideline values (AScI 1997). Samples were then ranked according to their overall contamination using the ranking procedure defined by GLNPO (EPA 1994 as cited in AScI 1997). Results for PAHs from this study were determined to be unreliable. The results from the enzyme immunoassay screening method used to detect PAHs did not correspond with the results from the confirmatory method. As a result, the PAH concentrations were determined to be inaccurate and were not used to assess sediment quality in the AScI report.

Five constituents (chromium, lead, nickel, zinc, and total PCBs) were present in elevated concentrations in a significant number of the samples collected from the Maumee AOC. Concentrations of these constituents increased with increasing depth in 20 percent of the cores collected. This sediment assessment identified three prominent hot spot areas of elevated concentrations of these constituents: (1) the area immediately adjacent to the eastern side of the sway bridge that is located north of the U.S. Route 280 bridge (sway bridge); (2) the wastewater treatment plant (WWTP) facility located on the western bank of the river approximately 1.5 miles downstream of the sway bridge; and (3) the outermost area of the Duck Creek confluence near the mouth of the Maumee River (Figure 2-1).

2.2 DUCK AND OTTER CREEKS SEDIMENT ASSESSMENT

The Duck and Otter Creeks sediment assessment was performed within the confluences of Duck and Otter Creeks in the LMR in Toledo, Ohio (Figure 2-1). Both creeks are urban creeks that flow northward and are part of the Maumee AOC; Duck Creek discharges to the Maumee River and Otter Creek discharges to Maumee Bay (Weston 2012a). The biological communities of both creeks have been identified as impaired; this impairment is thought to be a result of both historical habitat modification and chemical contamination. To understand the extent to which these physical and chemical stressors contribute to the biological impairment of Duck and Otter Creeks, GLNPO and the Duck and Otter Creeks Industrial Partners entered into an agreement under the Great Lakes Legacy Act (GLLA) to conduct a sediment investigation in these areas (Weston 2012a). The objectives were to determine the extent of contamination in surface and subsurface sediment, evaluate sediment toxicity and the causes of toxicity (where possible), and collect data to support a feasibility study (FS) if one were found to be necessary for the site.

Sediment sampling in Duck and Otter Creeks was conducted in two field efforts: the first in November 2010 was conducted using the research vessel *R/V Mudpuppy II*; the second in May 2011 was conducted using a pontoon vessel with a vibracore sampler to access shallow water areas (Weston 2012a). Sediment cores were collected at 11 locations in Duck Creek and 20 locations in Otter Creek. Ponar grab samples of the top 6 in. of sediment were collected at both Duck and Otter Creeks sample locations for toxicity and/or chemical testing. A total of 103 sediment samples were collected from the cores for chemical analyses. Table 2-2 presents the sampling scheme and analyses performed on samples from Duck and Otter Creeks.

Total PCBs were identified as the primary constituent of concern (COC) for the Duck Creek confluence area based on the widespread horizontal extent of PCB concentrations that exceeded probable effects concentrations (PECs). Total PCB exceedances were found between 24 in. below sediment surface and the deepest interval (varying from 6 feet [ft] to 14 ft) in the sediment cores. In Otter Creek, PAHs were the primary concern based on widespread exceedance of PAH PECs in the upper 24 in. of sediment. Further detail on the results of the Duck and Otter Creeks sediment assessment are presented in Section 4.3.1.

2.3 PHASE 1 LOWER MAUMEE RIVER SEDIMENT ASSESSMENT

The Phase 1 LMR Sediment assessment was conducted as part of the Maumee AOC GLLA project. The Phase 1 project area of the Maumee River extends 5 miles and is bound on the downstream end by the U.S. Route 280 bridge, and on the upstream end by Clark Island. The land surrounding the project area is largely industrial and commercial. The Phase 1 sewershed is also influenced by residential combined sewer overflows. The purpose of the Phase 1 sediment assessment effort was to collect and analyze sediment samples from the Phase 1 project area (Figure 1-2) for the chemical and physical properties necessary to support a full site characterization of the LMR and to support any potential remediation that may occur in the area (Weston 2012b).

Sediment cores were collected from 84 locations in the Phase 1 project area. Sediment samples were collected from intervals of: 0 to 6, 6 to 24, 24 to 48, 48 to 72, 72 to 96, 96 to 120, 120 to 144, and 144 to 168 in. below the sediment surface. A total of 337 sediment samples (including quality assurance samples) were analyzed for Target Analyte List metals and semivolatile organic compounds (SVOCs). Ten percent of the samples were also analyzed for PCB aroclors and pesticides (Table 2-3).

Neither total PCBs nor pesticides were identified as COCs for the Phase 1 project area. PCB aroclors were not detected in any of the 10 percent subset of sediment samples, and no samples had pesticide concentrations that exceeded PECs. Elevated concentrations of metals were found in isolated areas throughout the project area, extending horizontally along both the east and west shoreline of the river. Elevated concentrations of metals were also found at depth in several samples. High concentrations of SVOCs were found at one upstream sample location and one downstream sample location of the Phase 1 project area. Highest concentrations were found at the sampling location nearest to the confluence of Swan Creek and Maumee River; however, due to poor core recovery at this location, the vertical extent of SVOCs that exceed the PEC was not defined (Weston 2012b).

2.4 METHODOLOGY FOR INCORPORATION OF DATA FROM PREVIOUS INVESTIGATIONS INTO THE SITE CHARACTERIZATION REPORT

The results from the Duck and Otter Creeks sediment assessment (Weston 2012a) site characterization and the AScI sediment assessment were evaluated with the results from the Phase 2 sediment investigation to assess the sediment quality for the area (Figure 1-1). These studies provide recent data available on sediment chemistry and toxicity in the LMR area and helped to fill data gaps within the LMR and its nearby confluences. The only COCs identified in the Phase 1 study area were metals along the shoreline and SVOCs (which were found in elevated concentrations at two sample locations). Aside from source tracing of elevated constituents from Swan Creek into the Maumee River, there were no distinct horizontal or vertical trends in the elevated concentrations found in the Phase 1 area. Based on this information, the sediment chemistry data collected during the Phase 1 effort were not incorporated/combined with the Phase 2 data or with data from the other previous studies; rather, the general findings from the Phase 1 study were used, in conjunction with the modeling of COC concentrations from the Phase 2 study and other studies, to help draw conclusions about the overall sediment quality within the LMR.

Sediment chemistry data from both surface and subsurface samples from the AScI and Duck and Otter Creeks reports were combined electronically with the Phase 2 analytical results. Corresponding figures were produced that present the COC distribution in the Maumee AOC using both the data from these previous studies and the Phase 2 investigation (Section 5). While all relevant chemical data were incorporated with the Phase 2 analytical results, data modeling and interpretation focused on the three prominent hot spot areas (sway bridge, WWTP area, and Duck Creek confluence area) of elevated constituent concentrations as identified by previous sediment investigations. Pore water data and sediment toxicity data were evaluated in the Duck and Otter Creeks sediment assessment; while these data were not incorporated/combined into an

electronic database with the sediment chemistry data from the AScI study and Phase 2, they were summarized and interpreted to describe the overall distribution of elevated COCs in these areas of the Maumee AOC (Table 2-4).

3. PHASE 2 SITE INVESTIGATION

The purpose of the Phase 2 site investigation was to collect chemical and physical information for the Maumee River downstream of the U.S. Route 280 bridge to determine the extent of chemical contamination in both surface and subsurface sediments, to provide information about depositional areas, and to identify priority areas for remediation or for further investigation.

The Phase 2 Lower Maumee River site characterization was conducted in coordination with EPA and Ohio EPA. The investigations, including all sampling activities and analytical testing methods, were carried out in accordance with procedures outlined in the FSP and QAPP (EA 2013a, b).

3.1 SAMPLE DESIGN AND RATIONALE

The site-specific QAPP details the project data quality objectives and outlines how the sample collection will fulfill the project objectives (EA 2013a). Sampling was conducted to delineate the nature and extent of sediment contamination in the Phase 2 Area of the Maumee AOC.

3.1.1 Sample Locations

Ninety sample locations within the Phase 2 region of the AOC (Figure 3-1) were randomly chosen by a systematic sampling grid with a random start location using Visual Sample Plan 6.0. Assuming no false negative errors, the sampling scheme had the power to detect with a 95 percent probability of an elliptical hot spot with semi-major and semi-minor axes of approximately 526 and 316 feet (ft), respectively.

Based on information collected during the site reconnaissance effort, the location of some of the sample locations were adjusted to ensure that samples were collected outside of dredged areas and in locations not within or adjacent to utility crossings. Additionally, certain stations had to be abandoned and others created based on the site reconnaissance. Rationale for these location changes is presented in Table 3-1 of the FSP (EA 2013b). Variance from these coordinates was documented and difference between target and actual core location was quantified in feet and meters (Table 3-1).

A total of 90 locations were successfully sampled using a vibracoring system and direct push corer (Figures 3-1, 3-1A, 3-1B, 3-1C). One core was collected from each location for physical and chemical analysis. The Phase 2 area was divided into three separate areas for sampling. Area A extends from the Grassy Island in Maumee Harbor upstream to the river area adjacent to the Toledo Yacht Club (Figure 3-1A), and is comprised of the cove west of the Grassy Island and the main river channel excluding the federal navigation channel. Area B extends from the Toledo Yacht Club upstream to the river area adjacent to the southernmost sway bridge (Figure 3-1B). Area C extends from the sway bridge upstream to the U.S. Route 280 bridge (Figure 3-1C).

3.1.2 Number of Samples

A total of 359 sediment samples were collected from 90 sample locations (Table 3-2). Samples were collected from the following intervals: 0 to 12 in., 12 to 24 in., and every 24 in. thereafter [24 to 48 in., 48 to 72 in., etc.] to the end of each core. Sediment from each depth interval was homogenized prior to separation into individual containers for submittal to the laboratory for analysis. Sediment samples were collected at depth intervals by vibracore or by direct push (top 12 in. of sediment only) (Section 3.3). Because the initial proposed sampling intervals were adjusted in the field (after consultation with EPA), a ponar grab was not used to collect surface sediment. This deviation from the QAPP/FSP is further described in Section 3.3.

3.2 NAVIGATION AND SURVEY

The sampling vessels for this field effort included EPA's *R/V Mudpuppy II* and the Ohio EPA's smaller jon boat. Each vessel navigated to a proposed sampling location using a global positioning system (GPS) with sub-meter accuracy. When a handheld GPS was used (for coring at locations in the shallow cove of Area A), the unit was checked daily for accuracy prior to use, in accordance with the EPA's *Interim Guidance for Developing Global Positioning System Data Collection Standard Operating Procedures and Quality Assurance Project Plans* (EPA 2008) and the procedures outlined with the QAPP (EA 2013a). Once the vessel navigated to the proposed sample location, the sampling team visually confirmed the proximal location or surroundings to the location.

The onboard GPS of the *R/V Mudpuppy II* utilized the World Geodetic System 1984 to navigate and record each individual sampling location. For the 14 sample locations accessed from Ohio EPA's sediment sampling vessel, a handheld GPS that utilized the Ohio State Plan North, North American Datum 1983, was used. EA calibrated the GPS to three benchmarks in the morning prior to use by Ohio EPA, and then verified those benchmarks at the end of the day. The sample locations and coordinates are presented in Table 3-1.

3.3 SEDIMENT SAMPLING

Mobilization for the Lower Maumee River Phase 2 sediment sampling commenced on 09 June 2013. Sample collection was initiated on 10 June and continued through 20 June 2013. Modified Level D personal protective equipment (i.e., Saranex-coated Tyvek, safety glasses, work boots, and Nitrile gloves) were worn during core collection (EA 2013c). In addition, all personnel aboard the *R/V Mudpuppy II* had a respirator fit test within the last year, and respirators were onboard for each individual.

At each sampling location, surface water depth was measured to the nearest tenth of a foot prior to sediment sampling by using a rigid measuring device. Field books and sample collection data sheets were prepared in accordance with the procedures outlined in the FSP (EA 2013b) and EA standard operating procedures (SOPs) 016 and 059 (Appendix B of the QAPP).

3.3.1 Vibracore Sampling

A total of 76 of the 90 subsurface sediment samples were collected using a vibracoring system onboard the EPA's sampling vessel *R/V Mudpuppy II*. The onboard GPS of the *R/V Mudpuppy II* was used to navigate to each location. The vibracoring system consisted of a core liner with an inside diameter of 4 in. and a length of 10 or 15 ft fitted into the vibracoring unit with a one-way valve at the top to retain sediment during retrieval, and a plastic or stainless steel catcher inserted into the bottom of the core. Coring operations were conducted using an onboard crane, winch, and generator. Staging for the field effort took place at Brenner75 at Harrison Marina on N. Summit Street, Toledo, Ohio.

To obtain sediment samples, a dedicated, decontaminated cellulose acetate butyrate core liner was inserted directly into the vibracore unit and secured. The core was penetrated to the depth of refusal and then retrieved using the winch system. The core liner was removed from the vibracore unit and excess liner was cut to the sediment interface with an electric saw. The core was capped at both ends, sealed, and measured. Each core was labeled with the location number and direction of top and bottom of core.

A log of coring activities, sampling locations, water depths, and core recoveries was recorded in permanently bound logbooks in indelible ink. Personnel names, local weather conditions, and other information that impacted the field sampling program were also recorded. Each page of the logbook was numbered and dated by the personnel entering information. Copies of the field logbooks are provided in Appendix A.

3.3.2 Direct Push Core Sampling

Fourteen locations in the cove west of Grassy Island (LMR13-02, LMR13-05, LMR13-06, LMR13-09, LMR13-10, LMR13-11, LMR13-13, LMR13-16, LMR13-18, LMR13-19, LMR13-17, LMR13-20, LMR13-23, and LMR13-24) were sampled by Ohio EPA using direct push coring from a small jon boat that could navigate the shallow depths (Figure 3-1A). A Trimble GEOX Handheld GPS was used to navigate to each location. The handheld GPS unit was calibrated by EA personnel prior to sampling. Direct push cores were collected using an Argus Hazco© stainless steel Sludge Sampler with a one-way valve, and fitted with 3.25 in. by 12 in. core liner. Coring operations were conducted onboard a jon boat provided by Ohio EPA. Water depths are presented in Chapter 4.

To obtain sediment samples, a dedicated, decontaminated core liner was inserted into the direct push core unit and secured. The core was penetrated to the depth of 12 in., then retrieved. The core was capped at both ends, sealed, and measured. Each core was labeled with the location number and direction of top and bottom of core.

Following collection, sediment cores were transferred to a refrigeration truck (cooled to 4 degrees Celsius [°C]) at the on-shore staging area. The cores were stored in the secured refrigeration truck until they could be processed. A log of coring activities, sampling locations,

water depths, and core recoveries was recorded in permanently bound logbooks in indelible ink. Personnel names, local weather conditions, and other information that impacted the field sampling program were also recorded. Each page of the logbook was numbered and dated by the personnel entering information. Copies of the field logbooks are provided in Appendix A.

3.3.3 Sediment Core Processing

Sediment sample processing was performed onshore at a temporary location; Brenner75 at Harrison Marina. At the processing facility, cores were split lengthwise for examination and sampling. The cores were logged and photographed from the top of the core (sediment surface) to the bottom (recovery depth), representing a vertical profile of the soft sediment. Sediments were classified in general accordance with the Unified Soil Classification System under ASTM International D2487-11. These sediment logging activities were performed in accordance with SOP 016 (Appendix B of the QAPP).

After the log was completed, the sediment from each subsample interval was removed from the core or grab sampler with a clean stainless-steel spatula or spoon and placed in a clean disposable pan or stainless steel tray. Cores collected via vibracoring were subsampled at several depth intervals, while whole-core composites were created from the cores collected via direct push. Cores samples were homogenized by removing all material collected from the designated depth interval in a single core and mixing until consistency was uniform. Sediment samples were packaged and shipped in accordance with EA SOPs (EA 2013a). Equipment that was re-used (e.g., cutting tools, broad knife, spatula, bowls, etc.) were decontaminated in accordance with the decontamination procedures described in Section 3.6. Lithologic and photographic logs of sediment cores are included in Appendix B and C, respectively.

3.4 ANALYTICAL PROGRAM

Tables 3-2 and 3-3 summarize the analytical program. Each sediment sample underwent the following analyses:

- PCBs – aroclors
- Total organic carbon (TOC)
- SVOCs
- Oil and grease
- Total metals (arsenic, cadmium, chromium, copper, lead, nickel, zinc)
- Total mercury

In addition, based on a preliminary review of PCB aroclor data, 10 percent of samples were selected and submitted for analysis of PCB congeners.

Sediment samples from the 0 to 1 ft interval were analyzed for:

- 34 PAHs (approximately 10 percent of total samples)

- Acid volatile sulfide (AVS)/simultaneously extracted metals (SEM) (approximately 10 percent of total samples)
- Grain size
- Bulk density

These analyses were performed on surface sediment because the data they yield are useful for assessing toxicity to organisms that typically contact only the surface sediments. Grain size and bulk density analyses were performed at the sediment surface at each of the target locations collected by the *R/V Mudpuppy II*.

The 44 locations that were selected for the analysis of 34 PAHs and AVS/SEM are presented in Table 2-1 of the FSP (EA 2013b). The 44 sampling locations for both 34 PAHs and AVS/SEM comprised every other location sampled for the first 70 locations (35 samples) plus nine judgmental sampling locations at the surface only. Judgmental samples were selected in the field from locations with proximity to areas of potential historical contamination based on site features. Originally, seven judgmental sampling locations were planned; however, two judgmental sample locations were added (LMR13-94 and LMR13-95) after consultation with EPA.

EA collected and submitted a total of 359 samples for PCB aroclor analysis to TestAmerica laboratories. TestAmerica archived the samples at -10°C in darkness upon receipt. Following receipt and review of the preliminary results of the PCB aroclor results, EA and EPA collaborated to select 36 samples (based on highest total PCB concentrations) to be extracted and analyzed for PCB congeners. Matrix spike/matrix spike duplicate sample volumes were extracted from three of the 36 samples collected.

3.5 SAMPLE HANDLING, CHAIN-OF-CUSTODY, AND QUALITY ASSURANCE/QUALITY CONTROL

3.5.1 Sample Handling, Chain-of-Custody, and Documentation

Sediment samples analyzed for SVOCs, 34 PAHs, PCB aroclors, total metals (including mercury), TOC, AVS/SEM, density, and grain size were shipped from the site to TestAmerica's Burlington laboratory. Samples archived and analyzed for PCB-congeners were shipped to the Knoxville laboratory where they were stored in the freezer prior to extraction and analyses. Samples analyzed for oil and grease were shipped from site to TestAmerica's North Canton laboratory. Samples were placed in the appropriate sample containers (obtained from TestAmerica), preserved, and labeled in accordance with the QAPP/FSP (EA 2013a, b). In preparation for shipment to the laboratories, all samples were packaged in accordance with the procedures outlined in the FSP (EA 2013b).

Sample labeling was performed in accordance with SOP 001 (Appendix B of the QAPP). Individual sample containers were labeled with a unique designation that corresponded to the specific geographic location, year of collection, and subsample depth interval. The FSP (EA 2013b) outlines the specific sample identification procedures that were implemented. "LMR" was used for Lower Maumee River, and "13" was used to identify the sampling year 2013. Sample identifications included the location, LMR, year of sampling (13), location number, and the targeted end point of the interval in inches. An example of a sample identifier would be "LMR13-01-012." This identifier describes a sample taken at the LMR in 2013 at location 1, the depth interval of 0-12 in. below the sediment surface. Sample depths were from 0 to 12 in., 12 in. to 2 ft, and 2-ft intervals thereafter; therefore, the third field was identified as follows: 012, 024, 048, 072, 096, and 120.

Chain-of-custody forms were completed and used to track samples from the time of sampling to the arrival of samples at the laboratory. Completed chain-of-custody forms are provided in Appendix A of the Data Usability Assessment Report (Appendix D).

3.5.2 Quality Control

Throughout the project, various measures were implemented to ensure the overall quality, credibility, and usability of the collected data. The field investigation activities included collection of additional quality control samples (e.g., duplicates, matrix spike/matrix spike duplicate, etc.) sufficient to meet the requirements of the data quality objectives as defined in Section A.7 of the QAPP (EA 2013a). Duplicate samples were submitted as described in Appendix A of the QAPP, and field and laboratory quality control requirements were completed in accordance with Section B.5 of the QAPP. Deviations from the QAPP/FSP (EA 2013a, b) can be found in Section 3.8.

3.6 DECONTAMINATION

Decontamination procedures were implemented during the field investigation to prevent cross-contamination between sampling locations. During sampling activities, disposable or dedicated sampling tools and materials were utilized whenever possible to minimize the decontamination efforts. Decontamination procedures were carried out in accordance with Appendix A of the QAPP (EA 2013a).

3.7 INVESTIGATION-DERIVED WASTE

Following collection of the sediment samples, investigation-derived waste was managed in accordance with the procedures described in the Appendix A of the QAPP (EA 2013a). In general, residual sediments and decontamination water were returned to the respective sample location onsite. Disposable materials and personnel protective equipment that came into contact with site sediments were bagged and disposed of as general municipal waste.

3.8 DEVIATIONS FROM THE QAPP AND FSP

The sampling intervals in the QAPP were adjusted in the field after consultation with the EPA. This change affected the top two sample intervals only. Instead of sampling each core from 0 to 6 in. (with additional surface volume collected with a ponar) and 6 in. to 2 ft, each core was sampled from 0 to 1 ft, and 1 to 2 ft. A ponar was not used. This change provided adequate volume for analytical samples and increased efficiency onboard the *R/V Mudpuppy II*, and consistency with surface samples collected by Ohio EPA.

Actual coordinates are presented in Table 3-1. A total of seven of the target sample locations (LMR13-19, LMR13-29, LMR13-35, LMR13-40, LMR13-50, LMR13-56, and LMR13-77) were moved during the field activities (Table 3-1). Location LMR13-19 could not be accessed by the Ohio EPA direct push corer because of deep water and was moved approximately 80 ft perpendicular to the channel. Locations LMR13-29 and LMR13-35 were moved offshore from the proposed locations due to shallow water. Locations LMR13-40 and LMR13-50 were moved because of the close proximity to underground utilities crossing the river. Location LMR13-56 was moved slightly offshore due to the close proximity to ongoing work along the seawall at the proposed location. Location LMR13-77 was moved because it was determined to be too close to location LMR13-35. One location (LMR13-73) was removed as a target location due to the close proximity of location LMR13-27. Two judgmental sample locations were added (LMR13-94 and LMR13-95) after consultation with EPA, in accordance with the QAPP (EA 2013a). Core penetration and recovery for each subsurface coring location were recorded in a field logbook and are presented in Table 3-1.

On 14 June 2013, an EA-rented field vehicle was broken into and a backpack was stolen that contained the only copies of the 35 core logs created for locations that were logged during the period of 11-14 June 2013. The property was not recovered. A narrative describing the steps taken to re-create the stolen logs from the digital photographs is provided in Appendix B.

4. RESULTS

4.1 DATA EVALUATION

The overall data quality objective for the project was to provide data of known and documented quality to characterize current site conditions. Data collected in the Phase 2 effort were validated by evaluating the completeness, correctness, and conformance of the data set against the method, SOP, or contract requirements documented in the QAPP/FSP (EA 2013a, b). The data review and validation achieved the project goals. The overall data review and validation program attained the project objectives with no adverse effects on data quality or usability.

The validated data collected under this Phase 2 investigation were compared to the consensus-based threshold effects concentrations (TECs) and the probable effects concentrations (PECs) of the Sediment Quality Guidelines for Freshwater Systems (MacDonald et al. 2000) to address the goals of this assessment. In addition to the TEC and PEC, metals detected in Phase 2 samples were also compared to Ohio EPA SRVs for metals (Ohio EPA 2008). Constituent concentrations exceeding the applicable sediment quality criteria were identified. Figures were prepared to visually present constituent concentrations and identify potential hot spots or focus areas within the study area. Hot spots are defined as any area where one or more constituents exceed the PEC at a minimum of two adjacent sample locations.

4.1.1 Comparison to Sediment Quality Guidelines

The Sediment Quality Guidelines were developed as informal (non-regulatory) guidelines for use in interpreting chemical data from analyses of sediments. Several biological-effects approaches have been used to assess freshwater sediment quality relative to the potential for adverse effects on benthic organisms, including the TEC/PEC (MacDonald et al. 2000) approach. The TEC and PEC levels were derived using concentrations with both effects and no observed effects (MacDonald et al. 2000). TECs typically represent concentrations below which adverse biological effects were rarely observed, while PECs typically represent concentrations in the middle of the effects range and above which effects were more frequently observed (MacDonald et al. 2000). Concentrations that are between the TEC and PEC represent the concentrations at which adverse biological effects occasionally occur.

The Ohio EPA has published SRVs for metals in Guidance for Conducting Ecological Risk Assessments (Ohio EPA 2008). Sediment concentrations from lotic surface water systems may be compared to the Ohio specific SRVs. These SRVs can be used in lieu of site-specific background concentrations for sediments for determining whether sediments have been impacted by anthropogenic activities.

4.1.2 Calculation of Total Polycyclic Aromatic Hydrocarbons and Total Polychlorinated Biphenyls

Detected values greater than or equal to the Method Detection Limit, but less than the laboratory Reporting Limit (RL), were J-qualified and are estimated. Analytes that were not detected were

U-qualified. When calculating total PAHs, results that were J-qualified were calculated using the result value, and results that were U-qualified were calculated using one-half the RL. Substituting one-half the RL (not detected [ND] = ½ RL) for each non-detect provides a conservative estimate of the concentration. This method, however, tends to produce results that are biased high; especially in data sets where many samples are non-detects. This overestimation is important to consider when comparing calculated total values to criteria. Total PCB aroclor concentrations were calculated by summing the concentrations of each PCB aroclor with non-detects set equal to zero (ND=0).

4.1.3 Simultaneously Extracted Metals /Acid Volatile Sulfide Ratio

The bioavailability of divalent metals to aquatic organisms is influenced by the presence of AVS. In low oxygenated environments (anaerobic), metals may precipitate with sulfides, making them unavailable for uptake by aquatic organisms. Using this method, six metals (cadmium, copper, lead, nickel, mercury, and zinc) were extracted, measured, and added together (including any values that were "J" qualified). If a metal was not detected, it was considered a zero in the calculation. The sum of the concentrations of these six metals was then compared to the amount of AVS detected in the same sediment sample. If AVS was not detected in the sample, the SEM/AVS ratio was not calculated.

An SEM/AVS ratio less than 1 indicates a high degree of probability that the metals are bound to organic material and not bioavailable to aquatic organisms. If the SEM/AVS is greater than 1, the metals in sediment exceed the sulfide binding ability and have a higher probability of being bioavailable to aquatic organisms.

4.2 RESULTS FROM THE PHASE 2 SEDIMENT INVESTIGATION

4.2.1 Core Recovery

The Phase 2 area was divided into three separate areas for sediment core collection. Area A extends from the Grassy Island in Maumee Harbor upstream to the river area adjacent to the Toledo Yacht Club (Figure 3-1A), and is comprised of the cove west of the Grassy Island and the main river channel, excluding the federal navigation channel. Area B extends from the Toledo Yacht Club upstream to the river area adjacent to the southernmost sway bridge (Figure 3-1B). Area C extends from the sway bridge upstream to the U.S. Route 280 bridge (Figure 3-1C).

The 14 cores collected by Ohio EPA in Area A had 1-ft maximum recovery due to limited site accessibility; limiting the length of the coring device that could be utilized. The shortest recovered core in this area was LMR13-09 (0.8 ft) (Table 4-1). The water depths at these core locations were too shallow to accommodate the *R/V Mudpuppy II*'s draft and were collected by direct push rather than vibracore.

The remaining 76 cores were collected to refusal depth aboard the *R/V Mudpuppy II*. Sediment recovery ranged from 0.8 (LMR13-56) to 15 ft (LMR13-34) (Table 4-1). Detailed lithographic

descriptions of the 90 collected cores are presented in Appendix B. Photographic logs are presented in Appendix C.

It is important to note that there is uncertainty associated with the depth to bedrock at each coring location. Very few cores were identified as having hit refusal at bedrock (Appendix B); therefore, it is uncertain if contaminated material exists below the maximum depths of the cores collected from each location.

4.2.2 Lithology

The sediment cores collected within the Phase 2 Lower Maumee River Site demonstrate a mixture of core profiles containing sediment types consistent with a fluvial system. Most cores were characterized by thick layers of silty clay overlain by a thin layer of silt. Native and non-native material such as shells, creosote/diesel odor, and creosote-soaked woody debris were frequently observed within various sediment types and depths.

Complete core logs and photographs are included in Appendices B and C. A general description of cores collected during the Phase 2 investigation is included in the text that follows.

Area A

Cores collected in Area A showed varying lithology. A majority of the cores were comprised mostly of silty clay that generally varied from about 4.5 ft to greater than 9.5 ft thick with layers of clayey sand, clay, or sand underneath, and frequently overlain by a top layer of brown/gray silt. Woody debris layers were found in several cores (LMR13-07, -13, -14) collected in the western portion of Area A just outside the cove. Layers of black silt and high shell density were found in cores LMR13-22 and -25 collected from the northernmost section of the river channel, and in cores LMR13-48 and -82 collected from the southern section of Area A. Large woody pieces and a thick layer of organic debris were also present in LMR13-82.

As discussed earlier, the 14 cores collected in the northwestern cove of Area A (Figure 3-1A) had 1-ft maximum recovery due to limited site accessibility. Cores from this area were comprised of silty clay, with the exception of LMR13-12 and LMR13-16; which were comprised primarily of thick, dense clay. Several cores collected from the southern end of the bay (LMR13-01, -03, -48) had a strong diesel odor in the silty clay, sandy clay, and clay layers. Whole shells and shell fragments were also commonly found in these cores.

Area B

The majority of cores collected in Area B were comprised of silty clay that generally varied from about 6 ft to greater than 10.5 ft thick, overlain either by a layer of silt or clayey silt that varied from 0.3 ft to 1.3 ft thick. Several cores demonstrate exceptions to this composition with intermixed layers of other sediment types such as clay, sandy clay, organics, and gravelly clay. LMR13-56, collected on the eastern side of the river adjacent to the sway bridge, was comprised only of gray, stiff clay with intermixed pebbles and gravel. Shell fragments and woody/organic

debris were often observed in the various sediment types such as silty clay, sandy clay, clay, and sand. The woody debris present in cores from Area B appeared to be creosote-soaked with a strong diesel odor. This woody debris and odor, along with visible contamination (e.g., black sheen in sediment), were observable in cores LMR13-55, -58, and -80.

Area C

Similar to Areas A and B, several cores collected in Area C were comprised mostly of silty clay. The thickness of the silty clay layers varied widely, from 0.6 ft to 8.5 ft. The top layer, ranging from 0.2 ft to 1 ft thick, was silt in nearly half of the cores collected in Area C. Other sediment types observed in the top layer included clayey silt, sandy silt, sandy clay, and gravely silt. Frequently, layers of other sediment types such as clay, sand, clayey sand, silty gravel, sandy clay, organics, and gravelly clay, were intercalated with the silty clay. Like sediment from Area B, shell fragments and woody/organic debris were often observed. Two cores collected in the northern portion of Area C (LMR13-88 and -95) near the sway bridge and a core collected just east of the lower turning basin (LMR13-30) showed visible contamination in the form of a black clayey layer that exhibited a strong creosote odor and a sticky hydrocarbon/non-aqueous phase liquid residue.

4.2.3 Bulk Sediment Results

A total of 359 sediment samples were submitted for oil and grease, TOC, PCB aroclors, and metals; 317 were submitted for semivolatile organics analysis (SVOA); 76 were submitted for particle size and density; 36 were submitted for PCB congeners; and 44 were submitted for single ion monitoring 34PAHs, and the ratio of SEM/AVS (Table 3-3). Detected concentrations of constituents were compared to TECs and PECs (MacDonald et al. 2000) where available. Detected concentrations of metals were also compared to SRVs (Ohio EPA 2008). Analytical results are presented in Tables 4-2 through 4-8 and are summarized in the following sections by analytical group. Analyte exceedances that were detected within one of the three prominent hot spot areas, as defined in previous sediment studies (see Section 2.1), are also described in the following sections.

Analytical samples were defined at 0 to 12 in. (0 to 1 ft), 12 to 24 in. (1 to 2 ft), and every 2 ft thereafter [24 to 48 in. (2 to 4 ft), 48 to 72 in. (4 to 6 ft), etc.] to the end of each core. Sample identifications included the location, LMR, year of sampling (13), location number, and the targeted end point of the interval in inches.

4.2.3.1 Grain Size, Particle Size, and Density

A total of 76 sediment samples were submitted for grain size, particle size, and density. Analytical results are presented in Table 4-2. Cores collected by direct push method in the cove of Area A (14 of the 90 total), and field duplicates were not submitted for grain size analysis in accordance with the QAPP and FSP (EA 2013a, b). The majority of samples (90 percent) were composed primarily (greater than 50 percent) of silt + clay; the remaining 10 percent were composed primarily of sand. Bulk density ranged widely across the samples from 0.6 to 1.7

grams per cubic centimeter. Most of the sediment samples collected had at least 50 percent of the sample pass through a 200-micron sieve. Particle size distribution graphs for each sample are presented in Appendix E.

4.2.3.2 Oil and Grease and Total Organic Carbon

A total of 359 sediment samples and 42 field duplicates were submitted for oil and grease and TOC analysis. Oil and grease were detected in 340 of the 359 samples submitted with concentrations ranging from 26 to 48,000 milligrams per kilogram (mg/kg) (parts per million [ppm]). Figures 4-1A (cove), Figure 4-1A (channel), 4-1B, and 4-1C display the oil and grease concentrations at each location and depth interval. The highest oil and grease concentrations (> 5,000 ppm) were observed in samples collected from locations LMR13-33, -43, -54, -57, -86, -87, -88, and -95; which were located near the sway bridge area (Figure 4-1B and 4-1C) and from LMR13-45, -46, and -93 near the WWTP (Figure 4-1A channel). Sediment in the Phase 2 area contained percent TOC ranging from 0.75 percent (LMR13-29-096) to 14.3 percent (LMR13-95-024). Oil and grease concentrations as well as TOC are provided in Tables 4-3A, 4-3B, and 4-3C.

4.2.3.3 PCB Aroclors

A total of 359 sediment samples and 42 field duplicates were submitted for PCB aroclor analysis. PCB aroclors were detected in 136 of the 359 samples submitted. Total PCB aroclor concentrations were calculated by summing the concentrations of individual PCB aroclors with non-detects set equal to zero (ND=0). Total PCB aroclor concentrations ranged from 5.3 micrograms per kilogram (µg/kg) (parts per billion [ppb]) (LMR13-72-072) to 12,860 ppb (LMR13-46-096). Figures 4-2A (cove), Figure 4-2A (channel), 4-2B, and 4-2C display the total PCB aroclor concentrations reported at each location and depth interval. The highest total PCB aroclor concentrations (> 3,200 ppb) were observed in samples collected from locations LMR13-43, -45, -46, and -93 near the WWTP area (Figure 4-2A channel) and from locations LMR13-63 and LMR13-91; which were collected near the Duck Creek confluence area (Figure 4-2A channel). Elevated concentrations were also detected at LMR13-13 and -14 near the cove in Area A. Individual PCB aroclor concentrations as well as total PCB aroclor concentrations are provided in Table 4-4A, 4-4B, and 4-4C.

In the areas where total PCB concentrations exceeded the PEC, several individual aroclors appear to be predominant. Of the nine aroclors analyzed, aroclor 1242, aroclor 1254, and aroclor 1248 had the highest concentrations near both the WWTP and the Duck Creek confluence area. Concentrations of these three aroclors exceeded two times the PEC in one or more samples from locations LMR13-43, -44, -46, and -93 near the WWTP, and locations LMR13-63 and -91 in the Duck Creek confluence. Aroclor 1242 had the highest concentration of any aroclor detected at both the WWTP (8,600 ppb at LMR13-46) and Duck Creek Confluence area (1,700 ppb at LMR13-91).

4.2.3.4 PCB Congeners

Following analysis of samples for PCB aroclors, the samples containing the highest concentrations of total PCBs were selected for analysis of PCB congeners. Thus, 36 of the samples sent to the laboratory (10 percent of the total number of samples submitted for PCB analysis) were analyzed for 209 individual PCB congeners.

PCB congeners were detected in each of the 36 samples submitted (Table 4-5). Ninety percent of the PCB congeners analyzed were detected in each sample. The highest individual congener concentrations were detected in samples collected within the WWTP area. The PCB congeners with consistently high concentrations were congeners 28, 70, 74, and 76, each with a maximum concentration of 1,700,000 ppb. Each of these congeners was detected at location LMR13-46 within the WWTP area in the deepest interval (Table 4-5). These four PCB congeners were detected in all other samples analyzed; however, concentrations detected in other parts of the Phase 2 study area (including the sway bridge and Duck Creek confluence areas), were comparatively low.

Maximum concentrations of 170 of the 209 PCB congeners were detected in samples from locations LMR13-43, -45, and -46; all of which are located in the WWTP area. The majority of these maximum detected concentrations were greater than 100,000 ppb (Table 4-5). The concentration of total PCB congeners was also highest at these locations (Table 4-5).

4.2.3.5 Semivolatile Organic Analysis

A total of 317 sediment samples and 37 field duplicates were submitted for SVOA analysis. SVOAs were detected in each of the samples submitted for analysis. Total 17PAH concentrations were calculated by summing the concentrations of individual PAHs with ND=½RL. Total 17PAH concentrations ranged from 534 µg/kg (ppb) (LMR13-35-072) to 27,950,000 ppb (LMR13-95-024). Nineteen percent of the submitted samples had concentrations that exceeded the PEC. It is important to note that in some samples, individual PAHs were detected in concentrations that exceeded the respective PEC; however, when these individual PAH concentrations were summed, the total did not exceed the PEC for total 17PAH. Figures 4-3A (cove), 4-3A (channel), 4-3B, and 4-3C display the total 17PAH (ND=½ RL) concentrations reported at each sample location and depth interval. The highest total 17PAH concentrations occurred at locations LMR13-87, -88, -94, and -95 (Figure 4-3C) in the vicinity of the sway bridge. LMR13-54 and -55, downstream of the sway bridge, also had high concentrations. Concentrations of individual SVOAs as well as total 17PAH concentrations are reported in Tables 4-6A, 4-6B, and 4-6C.

In the areas where total 17PAH concentrations exceeded the PEC, several individual PAHs appear to be predominant. Of the 17 PAHs analyzed, anthracene, chrysene, fluoranthene, naphthalene, phenanthrene, and pyrene had the highest concentrations near the sway bridge area. Concentrations of these six PAHs exceeded three times the PEC in one or more samples throughout the cores collected from locations LMR13-54, -55, -87, -88, -94, and -95. Napthalene had the highest concentration of any PAH detected at the sway bridge (12,000,000 ppb at LMR13-95). At each location in this area, concentrations of naphthalene were consistently the highest of the individual PAHs detected in each sample.

Although total 17PAH concentrations were significantly lower near the WWTP, several locations (LMR13-43 and -46) had total concentrations exceeding the PEC. Four individual PAHs (chrysene, phenanthrene, pyrene, and naphthalene) appear to be driving the high total 17PAH concentrations. Similar to the samples from the sway bridge area, napthalene had the highest concentration of any individual PAH detected at the WWTP (12,000 ppb at LMR13-43).

4.2.3.6 Polycyclic Aromatic Hydrocarbons

A total of 44 surface (0-12 in.) sediment samples and five field duplicates were submitted for 34PAH analysis. 34PAH analysis includes the 17PAHs analyzed in the 317 samples submitted for SVOA analysis (Section 4.2.3.5) and 17 additional PAHs. All of the 17 additional PAHs were detected in each of the samples submitted for 34PAH analysis; however, none of the additional 17PAHs have individual TEC or PEC values, and thus no comparison criteria are available for total 34 PAHs. Concentrations of individual PAHs as well as total 17PAH and total (ND=½RL) 34PAH concentrations for the 44 surface samples and five duplicates are reported in Table 4-7.

Total (ND=½RL) 34PAH concentrations ranged from 475 µg/kg at LMR13-78-012 to 4,371,000 µg/kg (ppb) LMR13-95-012 near the sway bridge. Concentrations were also elevated at sample locations LMR13-88, -55, -57, and -94. Although there are no TEC or PEC concentrations available for total 34PAHs, some trends can be noted from the total concentrations. In samples where total 17PAHs were elevated above the TEC or PEC, the total 34PAH concentration was also high (Table 4-7). In many cases, the total 34PAH concentration was approximately double the total 17PAH concentration for the same sample; which is expected given that double the number of compounds were analyzed during the 34PAH analysis. For a few samples (LMR13-21, -25, -51, -66, and -69), however, the 34PAH concentration is more than double the total 17PAH concentration. At location LMR13-21, this larger increase in concentration results in the 34PAH concentrations above the total 17PAH TEC, which suggests that PAH exceedances could potentially be missed if only the 17PAH analysis is performed on a sample.

4.2.3.7 Metals

A total of 359 sediment samples and 42 field duplicates were submitted for metals analysis. Each of the eight analyzed metals exceeded the respective PEC in at least one sample. Five of the eight metals (cadmium, chromium, lead, nickel and zinc) exceeded respective PECs in

greater than 5 percent of the samples. In some samples, individual metal concentrations exceeded the TEC, but were below the SRV. Individual metal concentrations that exceeded the respective PEC also exceeded the SRV, as SRVs were consistently more conservative than the PECs for each individual metal. The detected concentration for each metal at each location and depth interval is displayed in the following figures: 4-4A (cove), 4-4A (channel), 4-4B, 4-4C (cadmium); 4-5A (cove), 4-5A (channel), 4-5B, 4-5C (chromium); 4-6A (cove), 4-6A (channel), 4-6B, 4-6C (lead); 4-7A (cove), 4-7A (channel), 4-7B, 4-7C (nickel); and 4-8A (cove), 4-8A (channel), 4-8B, 4-8C (zinc). Concentrations of individual metals are reported in Tables 4-8A, 4-8B, 4-8C.

Arsenic concentrations ranged from 2.2 mg/kg (LMR13-75-024) to 38.4 mg/kg (ppm) (LMR13-33-012). Thirty-four percent of the arsenic sample concentrations exceeded the TEC, and only two individual samples had concentrations that exceeded the PEC (Tables 4-8A, 4-8B, 4-8C). Twenty-four percent of the arsenic sample concentrations exceeded the SRV.

Cadmium concentrations ranged from 0.19 ppm (LMR13-35-072, LMR13-62-096, LMR13-75-024, and LMR13-79-096) to 15.4 ppm (LMR13-43-024). Figures 4-4A (cove), Figure 4-4A (channel), 4-4B, and 4-4C display the cadmium concentrations reported at each location and depth interval. Forty-eight percent of the detected cadmium concentrations exceeded the TEC, 6 percent exceeded the PEC, and 1 percent were more than two times the PEC (Tables 4-8A, 4-8B, 4-8C). Fifty-five percent of the cadmium sample concentrations exceeded the SRV.

Chromium concentrations ranged from 8 ppm (LMR13-21-072) to 319 ppm near the WWTP (LMR13-45-072). Figures 4-5A (cove), Figure 4-5A (channel), 4-5B, and 4-5C display the chromium concentrations reported at each location and depth interval. Twenty-one percent of the detected chromium concentrations exceeded the TEC, 7 percent exceeded the PEC, and 3 percent were more than two times the PEC (Tables 4-8A, 4-8B, 4-8C). Twenty-five percent of the chromium sample concentrations exceeded the SRV.

Copper concentrations ranged from 3.4 ppm (LMR13-79-024) to 172 ppm (LMR13-45-072). Forty-seven percent of the copper sample concentrations exceeded the TEC and 1 percent exceeded the PEC (Tables 4-8A, 4-8B, 4-8C). Twenty-five percent of copper sample concentrations exceeded the SRV.

Lead concentrations ranged from 3.2 ppm (LMR13-79-024) to 665 ppm (LMR13-55-072). Fifty-three percent of the detected lead concentrations exceeded the TEC, 12 percent exceeded the PEC, and 2 percent were greater than two times the PEC. Figures 4-6A (cove), Figure 4-6 (channel), 4-6B, and 4-6C display the lead concentrations reported at each location and the depth interval. The highest lead concentrations were detected at locations LMR13-33, LMR13-54, LMR13-55, and LMR13-57 near the sway bridge (Figures 4-6B and 4-6C) (Tables 4-8A, 4-8B, 4-8C). Fifty-seven percent of lead sample concentrations exceeded the SRV.

Mercury concentrations ranged from 0.024 ppm (LMR13-79-048) to 2.1 ppm (LMR13-46-096). Forty percent of the mercury sample concentrations exceeded the TEC and 1 percent exceeded

the PEC (Tables 4-8A, 4-8B, 4-8C). Forty-one percent of mercury sample concentrations exceeded the SRV.

Nickel concentrations ranged from 7.2 ppm (LMR13-79-024) to 141 ppm (LMR13-45-072). Sixty-nine percent of the detected nickel concentrations exceeded the TEC, 6 percent exceeded the PEC, and 3 percent were greater than two times the PEC. Figures 4-7A, 4-7B, and 4-7C display the nickel concentrations reported at each location and the depth. The highest nickel concentrations were detected at locations LMR13-43, LMR13-45, and LMR13-46 near the WWTP (Figure 4-7A (channel) and 4-7B) (Tables 4-8A, 4-8B, 4-8C). Thirty-two percent of nickel sample concentrations exceeded the SRV.

Zinc concentrations ranged from 20.5 ppm (LMR13-79-024) to 1,210 ppm (LMR13-45-024FD). Sixty percent of the detected zinc concentrations exceeded the TEC, 7 percent exceeded the PEC, and 1 percent were greater than twice the PEC. Figures 4-8A, 4-8B, and 4-8C display the zinc concentrations reported at each location and the depth interval. The highest zinc concentrations were detected at locations LMR13-33, LMR13-45, and LMR13-87 (Tables 4-8A, 4-8B, 4-8C). Thirty-eight percent of zinc sample concentrations exceeded the SRV.

The predominant metals within the Phase 2 area are cadmium, chromium, lead, and zinc. These metals have the highest concentrations in samples collected from the WWTP area. Cadmium, chromium, and lead concentrations were higher than other metals at LMR13-42, -81, and -93, while zinc appeared to be the predominant metal at locations LMR13-43 and -46. Similarly, concentrations of lead and zinc were also highest of the detected metals at locations LMR13-54, -55, -57, and -87 in the sway bridge area.

4.2.3.8 Simultaneously Extracted Metals to Acid Volatile Sulfide Ratio

A total of 44 surface (0-12 in.) sediment samples and five field duplicates were submitted for the-ratio of SEM/AVS. Samples were only submitted for the surface (0-12 in.) interval. Nine locations (LMR13-15, -21, -30, -33, -39, -55, -70, -86, and -88) had a single sample with a ratio greater than 1. Locations LMR13-55, -86, and -88 are near the sway bridge area. These results suggest that the majority of metals are not bioavailable. SEM/AVS results are presented in Table 4-9.

4.2.4 Summary of Phase 2 Bulk Sediment Results

Sediment samples collected during the Phase 2 sampling effort were analyzed for oil and grease, TOC, PCB aroclors and congeners, metals, SVOAs, 34PAHs, particle size and density, and SEM/AVS. The cores collected were subsampled at up to six depth intervals depending on the length of the core.

In general, the highest concentrations of constituents were co-located in the areas of the WWTP, the sway bridge, and the outermost area of the Duck Creek confluence (Figure ES-3). The highest oil and grease concentrations were detected at locations close to the WWTP and the sway bridge areas. Total PCB aroclor concentrations were highest at location LMR13-46, with

elevated concentrations also detected at locations LMR13-43, -45, and -93 near the WWTP, and at locations LMR13-63 and LMR13-91 near the outermost area of the Duck Creek confluence. For most samples from these locations, total PCB aroclor concentrations increased with depth.

In the areas where total PCB concentrations exceeded the PEC, several individual aroclors appear to be predominant. Of the nine aroclors analyzed, aroclor 1242, aroclor 1254, and aroclor 1248 had the highest concentrations near both the WWTP and the Duck Creek confluence area. Concentrations of 17PAHs were highest at locations LMR13-87, -88, -94, and -95; with concentrations exceeding the PEC at most depth intervals. Of the 17 PAHs analyzed, anthracene, chrysene, fluoranthene, naphthalene, phenanthrene, and pyrene had the highest concentrations near the sway bridge area, and appear to be predominant. 34PAHs were measured in surface samples, and the highest concentration was detected at sample location LMR13-95. Other locations with elevated 34PAH concentrations were LMR13-55, -57, -88, and -94. The highest concentrations of each individual metal were found at sample locations LMR13-54 and LMR13-55 near the sway bridge area, and/or at sample locations LMR13-43, -45, and -46 near the WWTP. The predominant metals within the Phase 2 area were cadmium, chromium, lead, and zinc.

4.3 RESULTS FROM PREVIOUS INVESTIGATIONS

This section presents results from two previous sediment investigations conducted within the Maumee AOC: the 1995 screening survey conducted by AScI and the 2010 Duck and Otter Creeks sediment assessment conducted by Weston Solutions. The purpose of the Duck and Otter Creeks sediment assessment was to determine the extent of contamination in surface and subsurface sediment within the confluence area of these creeks (Weston 2012a). The objectives of the AScI assessment were to investigate the distribution and magnitude of contamination in sediments from the Maumee AOC. Samples were collected from the lower Maumee River, Ottawa River, Swan Creek, Otter Creek, Duck Creek, and Maumee Bay (AScI 1997) (Figure 2-1). While specific coordinates were not provided for the AScI samples, these locations were estimated to the highest degree of accuracy using the maps provided in the report.

Results for PAHs from the 1995 AScI study are not presented in the data summary of this report. This investigation measured total PAH concentrations; however, the results from the enzyme immunoassay screening method used to detect PAHs did not correspond with the results from the confirmatory method. As a result, the PAH concentrations were determined to be inaccurate and were not used to assess sediment quality in the AScI report, and are not considered in this site characterization.

The sediment chemistry results from the Phase 2 assessment (Section 4.2) have identified potential hot spot locations (locations of co-occurring constituents with concentrations elevated above the PEC) by the WWTP, sway bridge, and outer area of the Duck Creek confluence. Since these areas were also identified as potential hot spots in the previous sediment assessments, this results discussion will focus on these areas. Sample locations discussed in this section can be found in the figures of the corresponding reports presented in Appendix F.

4.3.1 Duck Creek Confluence Area

Both the screening survey conducted by AScI and the Duck and Otter Creeks sediment assessment identified an area of elevated concentrations of constituents located in the outermost portion of the Duck Creek confluence. This section discusses the primary COCs detected in this area.

Total PCBs

The 1995-1997 screening survey by AScl identified high concentrations of total PCB aroclors (greater than three times the PEC of 2,028 µg/kg [ppb]) throughout the sediment cores in six of the nine samples collected in the Duck Creek area. The highest total PCB concentrations were detected in surface sediments at sampling locations MR051 (11,400 ppb) and MR059 (16,800 ppb). MR059 was located near the center of the Maumee River at the Duck Creek confluence. MR051 was located approximately 600 ft south of MR059, at the outermost part of the Duck Creek confluence.

The 2010 sediment investigation by Weston identified lower total PCB aroclor concentrations than the AScI survey, although total PCB aroclors were still identified as the primary COC. The highest concentrations (greater than three times the PEC) were detected at depths of 6 to 14 ft along the center of the Duck Creek bay at sampling locations DC-16, DC-17, and DC-19. Total PCBs were not identified in surface sediments in this investigation; however, samples were not collected from the main body of the Maumee River where the high surface sediment PCB concentrations were detected in 1995.

Metals

Cadmium

Cadmium concentrations exceeding the TEC (0.99 mg/kg [ppm]) were reported in eight of the nine samples collected in the Duck Creek area in the AScI survey. The exceedances were identified in surface sediments of Duck Creek (DC01, DC02, DC05, and DC07) and throughout the sediment column in the main body of the Maumee River (DC03, DC04, MR051 and MR059). No exceedances of the PEC (4.98 ppm) were reported. The highest concentrations were detected in surface sediments at DC02 (4.42 ppm) and at a depth of 4-6 ft at MR059 (4.43 ppm).

The 2010 Weston investigation identified cadmium at concentrations exceeding the TEC in all 11 samples collected in the Duck Creek area. Concentrations exceeding the PEC (4.98 ppm) were detected at depths of 10-16 ft in three samples near the center of the bay (DC-14, DC-16, DC-17). Cadmium concentrations appeared to increase with depth.

Chromium

Chromium concentrations exceeding the TEC (43.4 ppm) were reported throughout the sediment column in all nine of the samples collected in the Duck Creek area in the 1995 AScI survey. Exceedances of the PEC (111 ppm) were reported in two of the samples (DC-02 and DC-03).

The 2010 Weston investigation identified chromium at concentrations exceeding the TEC in six of 11 samples collected in the Duck Creek area. These exceedances were primarily located near the center of the bay at the Duck Creek confluence at depths of 8-16 ft. One exceedance of the PEC was reported at DC-14 at a depth of 10-12 ft. Chromium concentrations appeared to increase with depth.

Nickel

Nickel concentrations exceeding the TEC (22.7 ppm) were reported throughout the sediment column in each of the nine samples collected in the Duck Creek area in the 1995 survey. Concentrations also exceeded the PEC (48.6 ppm) in eight of the samples. The highest nickel concentrations were detected in the main body of the river near the confluence at sampling locations DC-03 (113 ppm) and MR051 (103 ppm).

The 2010 Weston investigation reported lower nickel concentrations than the 1995 survey; however, nickel concentrations still exceeded the TEC at all 11 sampling locations. Four samples also had concentrations that exceeded the PEC.

Lead

Lead concentrations exceeded the TEC (35.8 ppm) in eight of the nine samples collected in the 1995 survey. One exceedance of the PEC (128 ppm) was reported at DC05 at a depth of 2-3 ft. Lead concentrations appeared to decrease further from the creek with the lowest concentrations in the main body of the Maumee River.

The 2010 investigation identified lead concentrations exceeding the TEC in eight of 11 samples collected in the Duck Creek area. One exceedance of the PEC was reported at DC-20 at a depth of 4-6 ft.

Zinc

Zinc concentration exceeded the TEC (121 ppm) at eight of the nine sampling locations in the Duck Creek area during the 1995 survey. No exceedances of the PEC were found. Within the creek, surface sediments contained higher concentrations of zinc than deeper sediments. Within the main body of the Maumee River, concentrations were evenly distributed within the sediment. Zinc concentrations exceeding the TEC were detected at 10 of the 11 sampling locations during the 2010 investigation. None of the detected concentrations of zinc exceeded the PEC.

PAHs

Total 17 PAH concentrations exceeding the TEC (1,610 µg/kg [ppb]) were detected at all 11 sampling locations in the Duck Creek area during the 2010 investigation. In addition, total 17 PAH concentrations exceeded the PEC (22,800 ppb) in three of the 11 samples. The 2010 investigation collected samples from surface sediments only. PAH results from the 1995 survey are not included in this analysis.

4.3.2 Wastewater Treatment Plant Area

Both the screening survey conducted by AScI and the Duck and Otter Creeks sediment assessment identified an area of elevated concentrations of constituents located on the western shore of the Maumee River immediately next to the WWTP facility. This section discusses the primary COCs detected in this area.

PCBs

The 1995-1997 screening survey by AScI identified high concentrations of total PCB aroclors (greater than three times the PEC = 2,028 µg/kg [ppb]) throughout the sediment cores in four of the six samples collected near the WWTP. Total PCB concentrations exceeding the PEC (676 ppb) were found in each of the six samples. The highest total PCB concentrations were detected in surface sediments at sampling locations MR054 (13,000 ppb) and MR041 (13,400 ppb). MR054 was located approximately 200 ft off of the northern bank of the river in the small bay near the plant. MR041 was located near the center of the river approximately 1,000 ft west of MR054. Exceedances of three times the PEC extended to approximately 1,900 ft south of MR054 at MR055. Generally, total PCB concentrations increased at depth with increasing distance from the main WWTP facility.

Metals

Cadmium

Cadmium concentrations exceeding the TEC were identified in five of the six samples collected in the WWTP area during the 1995 survey. Exceedances of the PEC were reported in four samples and exceedances of two times the PEC were reported in two samples. The highest cadmium concentrations were detected in surface sediments at MR-26 (15.8 mg/kg [ppm]) and at depth of 2-4 ft at MR-29 (11.2 ppm).

Chromium

Chromium concentrations exceeding two times the PEC (222 ppm) were detected in four of the six samples collected in the 1995 survey at depths of 0-6 ft. All samples exceeded the TEC (43.4 ppm). The highest concentrations were detected at sampling locations MR-29 and MR054, both located in the small bay adjacent to the WWTP.

Nickel

Nickel concentrations exceeding the TEC (22.7 ppm) were detected in all six samples collected in the WWTP area during the 1995 survey. In addition, five of the six samples exceeded the PEC (48.6 ppm) and four of the samples exceeded twice the PEC (97.2 ppm). The highest nickel concentrations were detected at sampling locations MR-29 and MR054, both located in the small bay adjacent to the WWTP.

Lead

Lead concentrations exceeding both the TEC and the PEC were detected in five of the six samples collected from the WWTP area during the 1995 survey. The highest lead concentrations were reported at sampling locations MR-29 (298 ppm) and MR054 (248 ppm) at depths of 3-6 ft.

Zinc

Zinc concentrations exceeding both the TEC (121 ppm) and the PEC (459 ppm) were detected at five of the six sampling locations during the 1995 survey. The highest zinc concentrations were reported at sampling locations MR-29 (1,310 ppm) and MR054 (1,120 ppm).

4.3.3 Sway Bridge Area

Both the screening survey conducted by AScI and the Duck and Otter Creeks sediment assessment identified an area of elevated concentrations of constituents located on the eastern shore of the Maumee River immediately adjacent to the southernmost sway bridge. This section discusses the primary COCs detected in this area.

PCBs

The 1995 screening survey identified high concentrations of PCBs (greater than three times the PEC = 2,028 µg/kg [ppb]) throughout the sediment cores in all six of the samples collected near the sway bridge. The area covered by these samples extends from approximately 1,000 ft downstream of the bridge (MR-49) to approximately 1,600 ft upstream of the bridge. The highest PCB concentration of 348,000 ppb (51 times greater than the PEC) was reported at a depth of 2-3 ft at MR-32. MR-32 was located approximately 800 ft upstream of the bridge and approximately 300 ft north of the south bank of the river.

Metals

Cadmium

Cadmium concentrations exceeding the TEC were identified in five of the six samples collected in the sway bridge area during the 1995 survey. Exceedances of the PEC were reported in two samples (MR-33 and MR-49) at depths of 2-4 ft.

Chromium

Chromium concentrations exceeding both the TEC (43.4 mg/kg [ppm]) and PEC (111 ppm) were detected in all six samples collected from the sway bridge area during the 1995 survey. There was no distinct difference in chromium concentrations between surface sediments and deeper sediments.

Nickel

Nickel concentrations exceeded both the TEC (22.7 ppm) and PEC (48.6 ppm) in all six of the samples collected in the sway bridge area during the 1995 survey. There was no distinct difference in nickel concentrations between surface sediments and deeper sediments. The highest nickel concentration (292 ppm) was reported at sampling location MR-49 at a depth of 3-4 ft.

Lead

Lead concentrations exceeding the TEC (35.8 ppm) were detected in all six samples collected from the sway bridge area during the 1995 survey. Lead concentrations also exceeded the PEC (128 ppm) at three of the sampling locations. The highest lead concentrations were reported at MR-12 (260-404 ppm). The data provided in this report do not indicate a trend in lead concentrations with depth at the sway bridge area.

Zinc

Zinc concentrations exceeding the TEC (121 ppm) were detected in all six samples collected from the sway bridge area during the 1995 survey. Zinc concentrations also exceeded the PEC (459 ppm) at three of the sampling locations. The highest zinc concentrations (943-1340 ppm) were reported at MR-12 and MR-49. There was no distinct difference in zinc concentrations between surface sediments and deeper sediments.

5. SPATIAL ANALYSIS TO DETERMINE HOT SPOT AREAS WITHIN THE MAUMEE AOC

To further define the hot spot areas within the Maumee AOC, analytes with concentrations exceeding their respective PEC in Phase 2 sediment samples were spatially interpolated to develop an estimate of the concentration and distribution of constituents across the study area. Determination of hot spots will allow priority areas to be targeted for remediation.

Interpolation was performed by using a spatially explicit statistical method called kriging. This analysis focused on sediment data from the Phase 2 effort. Sediment data from previous investigations were not utilized in the model; however, these data were evaluated in combination with Phase 2 data in Section 6. Section 5.2 provides a brief overview of the areas identified by the kriging analysis as major impact hot spot areas and moderate impact hot spot areas with less elevated constituent concentrations.

5.1 METHODOLOGY

A three-dimensional model of each analyte measured in the Phase 2 sediment samples was constructed using the statistical interpolation method of kriging with C-Tech's Environmental Visualization System Pro Version. The model region excluded the navigation channel and was bounded on the bottom by the observed refusal depth at each core. Very few cores were identified as having hit refusal at bedrock; instead, refusal was typically at a clay layer. Output included each analyte's concentration at every location, and the results were combined to identify all locations with one or more analyte concentrations above the respective PEC levels, two times above the PEC levels, and three times above the PEC levels.

5.2 MODEL RESULTS FOR THE PHASE 2 STUDY AREA

The kriging analysis identified several hot spots within the Phase 2 study area where one or more analytes were present in concentrations exceeding the PEC at two or more adjacent locations. Figures 5-1A, 5-1B, and 5-1C present the results for all constituents exceeding their respective PECs in Areas A, B, and C. Model results for individual constituents are presented in Appendix G. Section 5.2.1 describes the major impact hot spots; major impact hot spots are defined as areas having concentrations of at least one constituent exceeding three times the PEC at a minimum of two adjacent sample locations. These areas have the largest estimated volumes of sediment with COCs exceeding the PEC. Section 5.2.2 describes moderate impact hot spot areas with less elevated constituent concentrations and smaller estimated sediment volumes exceeding the PEC. The volume estimations presented on Figures 5-1A, 5-1B, and 5-1C do not include contingency or overburden.

5.2.1 Major Impact Hot Spot Areas

Based on the interpolation results, three major impact hot spot areas are identified: (1) the Duck Creek confluence area; (2) the WWTP; and (3) the sway bridge area. The Duck Creek confluence area is located on the eastern side of the channel where Duck Creek empties into the

river (Figure 5-1A). The majority of this area has constituent concentrations of total PCBs and nickel exceeding two times above the PEC; while about one-quarter of the area has constituent concentrations exceeding three times above the PEC. The estimated volume of sediment with constituent concentrations exceeding the PEC is approximately 79,000 cubic yards (cy) (Figure 5-1A).

The WWTP area (Figures 5-1A and 5-1B) has constituent concentrations of total PCBs, total PAHs, and several metals (cadmium, chromium, nickel, lead, and zinc) exceeding three times above the PEC in spots both immediately next to the facility and in spots 500 ft upstream and downstream of the facility. Constituent concentrations exceeding the PEC and two times the PEC are present surrounding the areas where there are constituent exceedances of three times above the PEC. The estimated volume of sediment with total PCBs, total PAHs, and metals concentrations exceeding the PEC is approximately 337,000 cy (Figure 5-1B).

The sway bridge hot spot is located on the eastern side of the channel immediately flanking the upstream sway bridge in the Phase 2 study area (Figures 5-1B and 5-1C). Almost all of this area has concentrations of total PCBs and total PAHs exceeding three times above the PEC, with a small portion at the upstream end of the area exceeding two times above the PEC. The estimated volume of sediment with concentrations exceeding the PEC in the sway bridge area is approximately 125,000 cy (Figure 5 1B and 5-1C).

These major hot spots are discussed in further detail and are evaluated in combination with historical sediment data in Section 6.

5.2.2 Moderate Impact Hot Spot Areas

There are 21 smaller areas with measured concentrations of one or more constituents above PECs (Figures 5-1A, 5-1B, and 5-1C); however, 15 of these smaller areas are not considered moderate impact hot spots, as they have only a single sample with a constituent concentration elevated slightly above the PEC, and thus much smaller estimated volumes of impacted sediments than the three major hot spot areas described in Section 5.2.1.

The other six smaller areas are considered moderate impact hot spots; these either had concentrations of at least one constituent that exceeded the PEC by more than two times or were located in close proximity to one of the three major hot spot areas (Figures 5-1A, 5-1B, and 5-1C). These areas are:

- **A-1**: The majority of area A-1 (Figure 5-1A) has concentrations of total PCBs exceeding the PEC, with a small area exceeding two times and three times above the PEC. Samples at location A-1 were collected to the bottom of the core; however, the adjacent locations in the cove were only sampled at the surface by hand core. Since the model results from location A-1 show elevated total PCB concentrations at depth, there may be potential for elevated total PCB concentrations at depth in the cove samples.

- **B-3 and B-4**: Areas B-3 and B-4 are opposite from the WWTP and had constituent concentrations exceeding the PEC for the majority of both areas, with the exception of a small spot in area B-4 with concentrations exceeding two times greater than the PEC. COCs at these areas were total PCBs, lead, and nickel; which were all also COCs at the WWTP on the other side of the channel.

- **B-5**: Area B-5 is situated on the eastern side of the river and about halfway between the WWTP and sway bridge areas (Figure 5-1B and 5-1C). About one-quarter of this area has constituent concentrations exceeding three times above the PEC, and the remaining three-quarters exceeds either the PEC or two times above the PEC. COCs at this location are lead and total 17PAHs.

- **C-2**: Area C-2 is located on the western side of the river immediately opposite the sway bridge area. COCs at C-2 are arsenic, cadmium, chromium, lead, nickel, zinc, and total 17PAH (Figure 5-1C). These COCs are also present (with the exception of chromium) at elevated concentrations at the sway bridge area.

- **C-4**: Area C-4 is located on the western side of the river just downstream of the U.S. Route 280 bridge. COCs at C-4 are cadmium, lead, and total 17PAH (Figure 5-1C). These COCs are also present (with the exception of lead) at elevated concentrations at the sway bridge area.

6. COMPARISON OF MAJOR HOT SPOT AREAS WITHIN THE MAUMEE AOC TO HISTORICAL DATA

This section compares the bulk sediment chemistry results and kriging analysis results from the three major impact hot spot areas (the Duck Creek confluence, the WWTP, and the sway bridge), defined in Section 5, to historical sediment data collected in these locations. Since these three locations are likely the priority areas for initial remedial investigations in the Maumee AOC, comparison of data collected in the Phase 2 effort to previous studies will help to refine and verify the magnitude and extent of constituents exceeding benchmarks.

Each individual hot spot identified as a potential target for remediation is described in detail in Sections 6.1, 6.2, and 6.3. The sample locations, the maximum concentration of each constituent greater than the respective PEC, and the comparison of Phase 2 data to historical data are presented for each major impact hot spot area (Figures 6-1, 6-3, and 6-5). No exact sampling coordinates were available for the AScI samples; therefore, the sample locations were estimated to the highest degree of accuracy using the maps provided in the report. Additionally, the estimated depth of impacted material below the sediment surface, as determined from the Phase 2 sediment results and kriging analysis, is presented (Figures 6-2, 6-4, and 6-6). It is important to note that there is uncertainty associated with the depth to bedrock at each coring location. Very few cores were identified as having hit refusal at bedrock (Appendix B); therefore, it is uncertain if impacted material exists below the maximum depths of the cores collected from each location.

6.1 DUCK CREEK CONFLUENCE

The Duck Creek confluence hot spot includes Phase 2 sample locations LMR13-63 and LMR13-91 at the outermost part of the confluence area (Figure 6-1). Maximum total PCB concentrations from both locations exceeded three times the PEC for total PCBs, and nickel concentrations exceeded the PEC by more than three times at LMR13-91.

Two previous sediment investigations were performed at sample locations in close proximity to the Duck Creek hot spot (Figure 6-1). The investigation performed in 2010-2011 found total PCB concentrations exceeding the PEC at six locations (DC-13, DC-16, DC-17, DC-19, DC-21, and DC-25) that extended in a straight line out into the confluence area from just upstream of the discharge point of Duck Creek (Figure 6-1). The highest total PCB concentrations were detected at DC-17 and DC-19 approximately 500 ft from the termination of Duck Creek, suggesting deposition of material from the creek at the confluence. Nickel concentrations exceeding the PEC were also detected at sample locations throughout the confluence area (Figure 6-1). Three locations from this study showed concentrations of cadmium above the PEC (Figure 6-1). Chromium and lead exceedances were detected at only one sample location each.

The 1995 AScI sediment investigation at Duck Creek measured total PCB concentrations from three sample locations within the main river channel, two sample locations near the confluence point of Duck Creek, and four locations from within Duck Creek (AScI 1997) (Figure 6-1).

Sediment collected from MR-51, MR-52, and MR-59 in the river channel had total PCB concentrations more than three times the PEC and approximately four to five times higher than concentrations detected at the Phase 2 sample locations LMR13-63 and LMR13-9, 400 to 600 ft away (Figure 6-1). Locations DC-03 and DC-04 were positioned near the center of the confluence area and also had total PCB concentrations three times the PEC. The elevated total PCB concentration extended upstream into the creek; samples from locations DC-05 and DC-07 had total PCB concentrations that exceeded three times the PEC and that were higher than several downstream concentrations detected in both the AScI and Weston investigations. Six of the sampling locations had concentrations of nickel that exceeded two times the PEC; two of these six locations had concentrations exceeding three times the PEC. These locations were at the mouth of Duck Creek (DC-03) and west of the confluence area in the river channel (MR-51) (Figure 6-1).

When the Phase 2 kriging results for the Duck Creek confluence hot spot are combined with depth data for each sample location, it is clear that the highest concentrations of COCs (three times the PEC) for this area are located in deep sediment; suggesting burial of PCBs and nickel over time (Figure 6-2). This is supported further by the lack of sediment exceeding any PEC at the surface of the Duck Creek hot spot.

Taken together, the Phase 2 sediment data, the historical sediment data, and the Phase 2 data modeled at depth suggest that total PCB concentrations within the lower portion of Duck Creek have been elevated three times above the PEC since 1995, and that concentrations exceeding three times the PEC continue into the immediate confluence area at the mouth of the creek and into the outermost confluence area toward the river channel. The total PCB concentrations are variable between the creek and the outermost confluence area and no distinct trend is discernible from the data available.

6.2 WASTEWATER TREATMENT PLANT

The WWTP hot spot includes Phase 2 sample locations LMR13-42, -43, -44, -45, -46, -81, and -93 (Figure 6-3). The main COCs for this hot spot area were total PCBs and metals. Total PCB concentrations exceeded three times the PEC for all locations except for LMR13-81. Total 17PAHs and five metals each had at least one concentration exceeding the respective PEC or two times the PEC (Figure 6-3).

The 1995 AScI sediment investigation of the Lower Maumee River measured total PCB concentrations from six sample locations in the WWTP hot spot (AScI 1997) (Figure 6-3). Sediment collected from locations MR-054, MR-041, MR-026, and MR-055 had total PCB concentrations greater than three times the PEC. Phase 2 sample locations LMR13-45 and LMR13-43 were collected in close proximity to previous sample locations MR-054 and MR-041. Total PCB concentrations at the Phase 2 locations were much lower than those detected at the 1995 sample locations (Figure 6-3). Four of the six 1995 locations also had metal concentrations (cadmium, chromium, nickel, lead, and zinc) that exceeded two times the PEC in at least one sample.

When the Phase 2 kriging results for the WWTP hot spot are combined with depth data for each sample location, it is clear that the highest concentrations of COCs (greater than three times the PEC) for this area are dispersed throughout the sediment profile, with several areas of high concentrations on the surface as well as areas with elevated concentrations present at depth (Figure 6-4).

Taken together, the Phase 2 sediment data, the historical sediment data, and the Phase 2 data modeled with depth suggest that total PCB and metal concentrations within the WWTP hot spot have been elevated above the PEC since 1995, and that concentrations exceeding three times the PEC are present throughout the sediment profile. This suggests intervals of burial and deposition of contaminated sediments over the past 20 years.

6.3 SWAY BRIDGE

The sway bridge hot spot includes Phase 2 sample locations LMR13-54, -55, -86, -87, -88, -94, and -95 as well as six historical sample locations (Figure 6-5). The Phase 2 sediment results showed that the main COC for this hot spot area was total 17PAH. Total 17PAH concentrations exceeded three times the PEC in all samples from all locations with the exception of LMR13-86. Each Phase 2 sample location had at least one sample with a zinc concentration exceeding the respective PEC in the sway bridge hot spot; concentrations of five other metals (arsenic, lead, mercury, nickel, and zinc) also exceeded their PECs at this hot spot. Total PCB concentrations were below the PEC at all locations except LMR13-86; which had concentrations greater than three times the PEC (Figure 6-5).

The 1995 AScI sediment investigation of the Lower Maumee River sediment measured total PCB and metals concentrations from six sample locations in the sway bridge hot spot area (AScI 1997) (Figure 6-5). All samples collected from each of the six locations had total PCB concentrations greater than three times the PEC, with a maximum concentration of 348,000 µg/kg [ppb]. Samples collected during the Phase 2 effort from this same hot spot had total PCB concentrations below the PEC with the exception of LMR13-86. Most of the 1995 locations also had metal concentrations (cadmium, chromium, nickel, lead, and zinc) that exceeded the PEC in at least one sample. Locations MR-49 and MR-12 both had nickel and zinc concentrations that exceeded two times the PEC in more than one sample (Figure 6-5).

When the Phase 2 kriging results for the sway bridge hot spot are combined with depth data for each sample location, it is clear that the concentrations of COCs exceeding three times the PEC for this area are continuous throughout the sediment profile at all but one of the sample locations (Figure 6-6).

Taken together, the Phase 2 sediment data and the data modeled with depth suggest that elevated constituent concentrations within the sway bridge hot spot are fairly evenly distributed throughout the sediment profile and that total 17PAH is the predominant constituent at this hot spot. The individual PAHs contributing the most to the high concentrations are anthracene, chrysene, fluoranthene, naphthalene, phenanthrene, and pyrene. It is unclear whether or not historical PAH contamination existed at the sway bridge hot spot; the PAH data collected in the

1995 study were considered unreliable and were not used to assess sediment quality for that investigation (see Section 4.3). Although a direct comparison of Phase 2 PAH data to historical data cannot be made, total 17PAH concentrations exceeded three times the PEC in the deepest samples from Phase 2 sway bridge locations, indicating that burial of contamination has occurred over time. The discrepancy in total PCB concentrations in the historical versus Phase 2 samples may be due to the closer proximity of the historical sample locations to the bridge (Figure 6-5); the higher concentrations seen closer to the bridge could indicate a distinct deposit of material containing elevated total PCBs that does not extend further up or downstream from the bridge.

7. CONCLUSIONS

Based on the data collected during the Phase 2 sediment assessment in the Lower Maumee River, the major impact hot spot areas for sediment contamination are the Duck Creek confluence area, the WWTP, and the sway bridge area. These three major hot spots have an estimated total of 666,000 cy of sediment with constituent concentrations exceeding the PEC. Previous sediment investigations also found high concentrations of constituents located in these areas (AScI 1997; Weston 2012a).

The three major impact hot spot areas should be considered priority areas to focus future remediation efforts in the LMR. When evaluating both Phase 2 sediment data and historical sediment data together, it is evident that elevated concentrations of constituents in sediments at these hot spots have been present for several decades, and that burial of elevated concentrations has occurred to some degree at each of the three areas. Both recent data from the Weston study and historical data from the AScI study show that the Duck Creek confluence hot spot has elevated total PCB concentrations that begin in the lower part of the creek and continue into the immediate confluence area. Samples collected during the Phase 2 effort in the river at the outermost part of the confluence area show that total PCB concentrations are elevated into the channel. The data collected in 2010 and 2011 by Weston could be merged into an Environmental Visualization System model with the Phase 2 data collected by EA to determine if additional data are needed to better characterize nature and extent of consituents in the confluence area. Additionally, since both previous investigations found elevated total PCB concentrations within the creek, further evaluation of total PCBs in the creek warrants consideration.

Data from both the WWTP and sway bridge hotspots show burial of elevated constituent concentrations exceeding three times the PEC as well as some surface deposits with elevated concentrations. Sediment from both the WWTP and sway bridge hot spots had high concentrations of several metals with concentrations exceeding two and three times the PEC; however, the primary COCs for these areas are total PCBs and total 17PAHs due to both frequency and magnitude of exceedance. The high total PCB concentrations detected in the 1995 samples from the immediate vicinity of the sway bridge should be confirmed, particularly if there is potential that the total PCB concentrations could exceed Toxic Substances Control Act levels.

As discussed in Section 5.2.2, there are several moderate impact hot spot areas that demonstrated concentrations of one or more constituents above PECs. The majority of these locations contained only a single sample with a constituent concentration elevated slightly above the PEC, or had less than half the volume of contaminated sediment as compared to the three major hot spot areas (Figures 5-1A through 5-1C). As a result, the majority of these areas are not considered indicative of hot spots warranting priority remediation. Both the proximity to one of the three major impact hot spots and the elevated constituent concentrations found at areas B-3, B-4, and C-2 indicate that the larger hot spots may be acting as a source to these smaller deposits. Additionally, the elevated total PCB concentrations in deep samples from area A-1 suggest that there may be a need to further delineate potential elevated total PCB concentrations

in the cove of Area A, as only surface samples were collected at these locations during the Phase 2 investigation.

FIGURE 6-6

Spatial Analysis With Depth for the Sway Bridge Hot Spot-
Phase 2 Lower Maumee River

Table 2-2. Sampling Procedure and Analyses Performed for the 2010-2011 Duck and Otter Creek Sediment Assessment

Media	Parameter	Method	Number of Samples*
Surface Sediment (Ponar- 0 to 6 inches bss)	34PAHs	ASTM D7363	31
	TOC	SW-846 9060	31
	PCB aroclors	SW-846 8270C	31
	GRO/DRO/ORO	SW-846 8015	31
	SVOCs	EPA CLP SOM01.2/SVOC	31
	Metals	EPA CLP SOW ISM01.2/metals	31
	Grain size	ASTM D422	31
	SEM/AVS	EPA 3050/3010/6020/7471/9030	31
Subsurface Sediment (Vibracore- 7 depth intervals up to 14 ft bss)	SVOCs	EPA CLP SOM01.2/SVOC	31
	Metals	EPACLP SOW ISM01.2/metals	31
	GRO/DRO/ORO	SW-846 8015	31
	TOC	SW-846 9060	31
	PCB aroclors	SW-846 8270C	31
Porewater (collected as sediment)	34PAHs	ASTM D7363	31
	Metals	EPA CLP SOW ISM01.2/metals	31
	Hardness	SM2340B	31
	DOC	EPA 415.1	31
	Ammonia	SM4500-NH3	31
	pH	SM4500 H+B	31

*Total does not include field duplicate samples.

NOTES:
AVS = Acid volatile sulfide.
DOC = Dissolved organic carbon.
DRO = Diesel range organics.
GRO = Gasoline range organics.
ORO = Oil range organics.
PAH = Polycyclic aromatic hydrocarbon.
PCB = Polychlorinated biphenyl.
SEM = Simultaneously extracted metals.
TOC = Total organic carbon.
SVOC = Semivolatile organic compound.

Source: Weston 2012a.

Table 2-3. Sampling Procedure and Analyses Performed for the Phase 1 Sediment Assessment of the Lower Maumee River

Media	Parameter	Method	Number of Samples**
Surface and Subsurface Sediment (Vibracore)	SVOCs	Analytical methods not provided in Phase I report	303
	TAL Metals		303
	Grain Size		303
	TOC		303
	PCB Aroclors*		29
	Pesticides*		29

* Parameter measured in ten percent of the total samples.
**Total does not include field duplicate samples.

NOTES:
TAL = Target Analyte List.
PCB = Polychlorinated biphenyl.
TOC = Total organic carbon.
SVOC = Semivolatile organic compound.

Source: Weston 2012b.

Table 2-4. Incorporation of Historic Data for the Maumee River into the Site Characterization Report

Study	Analyses Performed	Level of Incorporation into Site Characterization Report
Screening Analysis Sediment Quality Assessment Study of the Maumee River AOC; 147 sample locations (AScI 1997)	Sediment chemistry	Add results to sediment chemistry database and create figures to display contaminant distribution in areas of elevated concentrations
Duck and Otter Creek Sediment Assessment; 31 sample locations (Weston 2012a)	Surface sediment chemistry: PAHs, TOC, GRO/DRO/ORO, SVOCs, PCBs, metals, grain size, AVS/SEM Subsurface sediment chemistry: SVOCs, PCBs, metals, GRO/DRO/ORO, TOC	Add results to sediment chemistry database and create figures to display contaminant distribution in areas of elevated concentrations
	Toxicity: 10-day growth/survival	Summarize study results and interpret to help describe sediment contamination within the Lower Maumee River
	Pore water: PAHs, metals, hardness, DOC, ammonia, pH	
Phase I Sediment Assessment; 84 sample locations (Weston 2012b)	Sediment chemistry: TAL metals and SVOCs; 10% of samples analyzed for PCB aroclors and pesticides	Summarize study results and interpret to help describe sediment contamination within the Lower Maumee River

NOTES:
AVS = Acid volatile sulfide.
DOC = Dissolved organic carbon.
DRO = Diesel range organics.
GRO = Gasoline range organics.
ORO = Oil range organics.
PAH = Polycyclic aromatic hydrocarbon.
PCB = Polychlorinated biphenyl.
SEM = Simultaneously extracted metals.
TOC = Total organic carbon.
SVOC = Semivolatile organic compound.

TABLE 3-2. PHASE 2 LOWER MAUMEE RIVER SITE CHARACTERIZATION SAMPLE COUNT
MAUMEE RIVER, TOLEDO, OHIO (JUNE 2013)

	Maximum Number of Samples Targeted for Collection			Total Number of Samples Submitted		
Constituent of Concern Analysis Identification	**Total Number of Primary Investigatory Samples**	**Field Duplicates**	**MS/MSD**	**Total Number of Primary Investigatory Samples**	**Field Duplicates**	**MS/MSD**
SVOA	378 +42 from SVOA/SVOASIM = 420	37 +5 from SVOA/SVOASIM = 42	18 +3 from SVOA/SVOASIM = 21	317	37	16
SVOA, SVOASIM (34 PAHs)	42	5	3	44	5	3
PCB Aroclors	420	42	21	359	42	18
Metals + Hg, TOC	420	42	21	359	42	18
AVS/SEM	42	5	3	44	5	3
Particle Size, Density	70	0	0	76	0	0
Oil and Grease - HEM	420	42	21	359	42	18
PCB Congeners	--	--	--	36*	0	3**

* Represents 10 percent of samples submitted for PCB aroclor analysis. Samples were selected for analysis based on review of the preliminary data.
** MS/MSD sample volume extracted from three of the primary samples.
AVS - Acid volatile sulfide.
HEM - Hexane extractable material
Hg - Mercury
MS/MSD - Matrix spike/matrix spike duplicate.
PCB - Polychlorinated biphenyl.
SEM - Simultaneous extracted metals.
SIM - Single ion monitoring.
SVOA - Semivolatile organics analysis.
TOC - Total organic carbon.

Table 3-3. Analytical Summary for the Phase 2 Sediment Investigation

Parameter	Method	Total Number of Samples*
SVOASIM (34 PAHs)	EPA CLP SOM01.2/SV SIM	44
SVOAs	EPA CLP SOM01.2/SVOA SIM	317
PCB aroclors	EPA CLP SOM01.2/PCB	359
PCB congeners	EPA 1668B	36**
TOC	Lloyd Khan	359
Oil and Grease (Hexane-Extractable Materials)	SW846 9071B	359
Total Metals with Mercury	EPA CLP ISM01.3/ICP/Mercury	359
SEM/AVS	EPA 3050/3010/6020/7471/9030	44
Grain Size	ASTM International D422	76
Bulk density	ASTM D2937	76

*Total does not include field duplicate samples.
** Number represents 10% of the 359 archived samples submitted to the analytical laboratory.

NOTES:
AVS = Acid volatile sulfide.
PCB = Polychlorinated biphenyl.
SEM = Simultaneously extracted metals.
SIM = Single ion monitoring.
SVOA = Semivolatile organics analysis.
TOC = Total organic carbon.

NOTES:
J = Indicates that the concentration is an estimated value.
U = Indicates the analyte was analyzed for but not detected.
Q =
B = Method blank contamination
C. =
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment
Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
NSL= No Screening Level
Submitted samples are presented in ascending numerical order.

NOTES:
J = Indicates that the concentration is an estimated value.
U = Indicates the analyte was analyzed for but not detected.
Q =
B = Method blank contamination
C =
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment
Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
NSL= No Screening Level
Submitted samples are presented in ascending numerical order.

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3A

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3A

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3A

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3A

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3A

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3A

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3A

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3A

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3A

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3B

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3B

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3B

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3B

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3B

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Bolded and Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3C

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Bolded and Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3C

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Bolded and Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3C

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Bolded and Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3C

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Bolded and Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3C

NOTES:
** Analytes included in the 17PAH total
J = Indicates that the concentration is an estimated value.
R = Result is rejected
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Bolded and Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.
*Samples presented are displayed in Figure 4-3C

NOTES:
* Included in calculation of total 17PAH
** Excluded from calculation of total 34PAH
J = Indicates that the concentration is an estimated value.
U = Indicates the analyte was analyzed for but not detected.
µg/kg = Micrograms per kilogram.
TEC = Threshold effect concentration.
Development and Evaluation of Consensus-Based Sediment
Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
PEC = Probable effect concentration.
Development and Evaluation of Consensus-Based Sediment
Quality Guidelines for Freshwater Ecosystems (MacDonald et al. 2000).
Bolded values exceed the TEC.
Gray shaded values exceed the PEC.
NSL = No Screening Level.
Submitted samples are presented in ascending numerical order.

Core Log and
Recreation Narrative

This page intentionally left blank.

Maumee River Core Log Re-creation

This is a narrative of the steps taken to re-create the 35 sediment core logs that were stolen on 6/14/13 in Toledo, Ohio.

While in the field, high-resolution photographs were taken (at a minimum) for each analytical sample interval for each core (0-12", 12-24", 24-48", 48-72", etc.). Additional high-resolution photographs were taken of unique features, such as a dense organic layer that had an intense diesel odor. These photographs were used by the field geologist who logged all of the cores to re-create the sediment logs immediately upon returning from the field (24-27 June 2013) and are presented in Attachment D. The lack of lithologic and stratigraphic variation between coring locations made this method of re-creation possible. Field maps were used to identify cores taken in close proximity to each other and correlate layers between them.

Excess sediment from the oil and grease analytical samples was archived and shipped to the field geologist in Hunt Valley, MD, in an effort to validate the sediment description derived from the photographs. These 140 sediment samples were used to spot-check the re-created core logs by randomly choosing analytical samples within each core to see if the description generally matched the sediment in the analytical sample. This was done with 30 (25 percent) of the sediment samples, presented in Table C-1. The sediment samples remain archived at EA's Ecotoxicology laboratory for future reference, if needed.

The re-created core logs were reviewed by EA's Chief Geologist and Director of Quality Control for accuracy and correctness.

Table C-1. Archived Analytical Sample* Descriptions

Sample ID	Description from Archived Sediment Sample
LMR13-81-096	Gray clay with some silt, some (20%) organic debris (grass) and small wood pieces 1-3 mm in size
LMR13-83-048	Gray sandy (fine, ~20%) clay with some (20%) small shells ~3mm and wood pieces ~2x2 cm in size.
LMR13-57-012	Gray silty clay with some (20%) organic (wood) debris 1-3 mm in size. Strong grease/oil odor.
LMR13-62-024	Gray silty clay with trace (5%) organic fragments ~ 1mm in size.
LMR13-63-024	Gray silty clay, moisture still high.
LMR13-50-012	Gray/brown silty clay with trace (10%) organic material (grass) up to 3 cm long.
LMR13-50-096	Gray silty clay with some (20%) organic (wood pieces) debris 0.5-1.5 cm in size.
LMR13-51-048	Gray sandy (30%) clay with trace (5-10%) shell fragments and organic debris 1-3 mm in size.
LMR13-72-024	Gray/brown silty clay with trace (15%) organic (wood) debris 1-5 mm. Faint grease odor.
LMR13-81-012	Dark gray silty clay with trace (5%) shell fragments ~1mm. Faint grease odor.
LMR13-90-048	Gray silty clay.
LMR13-91-072	Gray clay with trace (15%) organic (wood) pieces 1-5mm in size.
LMR13-93-024FD	Dark gray silty clay with trace (15%) small black shells 1-3 mm in size. Faint grease odor.
LMR13-93-120	Gray silty clay
LMR13-41-024	Gray silty clay with trace (10%) organic (grass) fragments 1-2 cm long.
LMR13-45-120	Dark gray silty clay with trace (10%) organic (wood pieces) debris 1-5 mm in size. Grease odor.
LMR13-46-072	Dark gray silty clay with some (20%) organic (wood, grass/roots) debris 1-5 cm long. Grease odor.
LMR13-47-012	Gray clayey silt with trace (10%) organic (grass, wood) debris 2-10 mm in size.
LMR13-47-096	Gray silty clay with trace (10%) organic (grass) fragments 1-5 mm long.
LMR13-49-072	Gray sandy (fine, ~20%) clay with some (25%) small shells ~1-3mm in size.
LMR13-42-024	Dark gray clayey silt
LMR13-43-048	Dark gray silty clay. Grease odor.
LMR13-44-048	Gray sandy (fine, ~20%) clay with trace to some (15-20%) shell fragments 1-3 mm in size.
LMR13-44-096	Gray clay with trace (10%) shell fragments 1-3 mm in size.
LMR13-45-024	Dark gray clayey silt with trace (10%) organic (wood) debris 1-3 mm in size. Grease odor.
LMR13-02-012	Gray sandy silty clay with some (25%) shell fragments 1-3 mm in size.
LMR13-11-012	Gray clayey silt with some (25%) shell fragments 1-3 mm in size and some (20%) wood debris 5-10 mm in size.
LMR13-20-012	Gray silty clay with some (25-30%) shell fragments 1-5 mm in size.
LMR13-27-048	Dark gray clayey silt with some (20%) shell fragments 1-3 mm in size.
LMR13-26-012	Gray silty clay with some (20%) shell fragments 1-3 mm in size; trace (10%) gravel; and trace (5%) organic (wood) debris 1-10 mm in size.

***** These 30 samples represent ~25% of the 140 archived sediment samples.

ATTACHMENT C

CORE RE-CREATION NARRATIVE

Maumee River Core Log Re-creation

This is a narrative of the steps taken to re-create the 35 sediment core logs that were stolen on 6/14/13 in Toledo, Ohio.

While in the field, high-resolution photographs were taken (at a minimum) for each analytical sample interval for each core (0-12", 12-24", 24-48", 48-72", etc.). Additional high-resolution photographs were taken of unique features, such as a dense organic layer that had an intense diesel odor. These photographs were used by the field geologist who logged all of the cores to re-create the sediment logs immediately upon returning from the field (24-27 June 2013) and are presented in Attachment D. The lack of lithologic and stratigraphic variation between coring locations made this method of re-creation possible. Field maps were used to identify cores taken in close proximity to each other and correlate layers between them.

Excess sediment from the oil and grease analytical samples was archived and shipped to the field geologist in Hunt Valley, MD, in an effort to validate the sediment description derived from the photographs. These 140 sediment samples were used to spot-check the re-created core logs by randomly choosing analytical samples within each core to see if the description generally matched the sediment in the analytical sample. This was done with 30 (25 percent) of the sediment samples, presented in Table C-1. The sediment samples remain archived at EA's Ecotoxicology laboratory for future reference, if needed.

The re-created core logs were reviewed by EA's Chief Geologist and Director of Quality Control for accuracy and correctness.

Table C-1. Archived Analytical Sample* Descriptions

Sample ID	Description from Archived Sediment Sample
LMR13-81-096	Gray clay with some silt, some (20%) organic debris (grass) and small wood pieces 1-3 mm in size
LMR13-83-048	Gray sandy (fine, ~20%) clay with some (20%) small shells ~3mm and wood pieces ~2x2 cm in size.
LMR13-57-012	Gray silty clay with some (20%) organic (wood) debris 1-3 mm in size. Strong grease/oil odor.
LMR13-62-024	Gray silty clay with trace (5%) organic fragments ~ 1mm in size.
LMR13-63-024	Gray silty clay, moisture still high.
LMR13-50-012	Gray/brown silty clay with trace (10%) organic material (grass) up to 3 cm long.
LMR13-50-096	Gray silty clay with some (20%) organic (wood pieces) debris 0.5-1.5 cm in size.
LMR13-51-048	Gray sandy (30%) clay with trace (5-10%) shell fragments and organic debris 1-3 mm in size.
LMR13-72-024	Gray/brown silty clay with trace (15%) organic (wood) debris 1-5 mm. Faint grease odor.
LMR13-81-012	Dark gray silty clay with trace (5%) shell fragments ~1mm. Faint grease odor.
LMR13-90-048	Gray silty clay.
LMR13-91-072	Gray clay with trace (15%) organic (wood) pieces 1-5mm in size.
LMR13-93-024FD	Dark gray silty clay with trace (15%) small black shells 1-3 mm in size. Faint grease odor.
LMR13-93-120	Gray silty clay
LMR13-41-024	Gray silty clay with trace (10%) organic (grass) fragments 1-2 cm long.
LMR13-45-120	Dark gray silty clay with trace (10%) organic (wood pieces) debris 1-5 mm in size. Grease odor.
LMR13-46-072	Dark gray silty clay with some (20%) organic (wood, grass/roots) debris 1-5 cm long. Grease odor.
LMR13-47-012	Gray clayey silt with trace (10%) organic (grass, wood) debris 2-10 mm in size.
LMR13-47-096	Gray silty clay with trace (10%) organic (grass) fragments 1-5 mm long.
LMR13-49-072	Gray sandy (fine, ~20%) clay with some (25%) small shells ~1-3mm in size.
LMR13-42-024	Dark gray clayey silt
LMR13-43-048	Dark gray silty clay. Grease odor.
LMR13-44-048	Gray sandy (fine, ~20%) clay with trace to some (15-20%) shell fragments 1-3 mm in size.
LMR13-44-096	Gray clay with trace (10%) shell fragments 1-3 mm in size.
LMR13-45-024	Dark gray clayey silt with trace (10%) organic (wood) debris 1-3 mm in size. Grease odor.
LMR13-02-012	Gray sandy silty clay with some (25%) shell fragments 1-3 mm in size.
LMR13-11-012	Gray clayey silt with some (25%) shell fragments 1-3 mm in size and some (20%) wood debris 5-10 mm in size.
LMR13-20-012	Gray silty clay with some (25-30%) shell fragments 1-5 mm in size.
LMR13-27-048	Dark gray clayey silt with some (20%) shell fragments 1-3 mm in size.
LMR13-26-012	Gray silty clay with some (20%) shell fragments 1-3 mm in size; trace (10%) gravel; and trace (5%) organic (wood) debris 1-10 mm in size.

***** These 30 samples represent ~25% of the 140 archived sediment samples.

1. INTRODUCTION

EA Engineering, Science, and Technology, Inc. (EA), on behalf of U.S. Environmental Protection Agency (EPA) Great Lakes National Program Office (GLNPO), has prepared this Data Usability Assessment Report (DUAR) to summarize the data review and data validation performed on the data sets collected from the field investigation at the Lower Maumee River Site from 22 to 26 October 2012, and determine whether the sample results meet the Data Quality Objectives (DQOs) outlined in the Quality Assurance Project Plan (QAPP) and Field Sampling Plan (FSP) for Phase 2 of the Lower Maumee River Site Characterization, Maumee Area of Concern (AOC), Toledo, Ohio (EA 2013), finalized May 2013.

The principal goals of the study derived from the DQO process are as follows:

1. Define the nature and extent of chemical contamination in the areas of soft sediment deposition, including depth of contamination; provide information about depositional areas; and identify high priority areas for remediation or for further investigation.

2. Develop preliminary estimates for the volume of contaminated soft sediment in these areas.

3. Identify hotspots.

4. Identify potential sources of contamination.

In order to address the goals of the study, sediment samples were collected and analyzed as outlined in the QAPP/FSP (EA 2013). Sediment samples were analyzed for semivolatile organic compounds (SVOCs), polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCB) Aroclors, metals, oil and grease, total organic carbon (TOC), acid volatile sulfide (AVS) and simultaneously extracted metals (SEM), percent moisture, and grain size.

2. SITE INFORMATION

The Maumee River has its headwaters in Fort Wayne, Indiana, and flows over 130 river miles to its mouth at Lake Erie in Toledo, Ohio. The Maumee has the largest drainage area of any Great Lakes river with 8,316 square miles. The Maumee AOC does not include the river in its entirety; rather, it includes the lower reach and tributaries, as well as some of the neighboring watersheds. This project will take place in the lowermost reaches of the Maumee River and at its confluence with Maumee Bay.

While the Maumee River has a long history of industrial use, there is little historical data, especially at depth, which identifies the nature and extent of contamination. It is believed that contaminated sediments in the study area contribute to beneficial use impairments (BUIs) in the AOC, but there is not enough historical data for the Maumee River to assess the impact of the contamination. Impairment of beneficial use means a change in the chemical, physical, or biological integrity of the Great Lakes ecosystem. The Maumee Remedial Action Plan (RAP) identifies the following BUIs for the Maumee River AOC:

- Restrictions on fish and wildlife consumption
- Eutrophication or undesirable algae
- Restrictions on drinking water consumption, or taste and odor
- Degradation of fish and wildlife populations
- Beach closings
- Fish tumors or other deformities
- Degradation of aesthetics
- Degradation of benthos
- Restriction on dredging activities
- Loss of fish and wildlife habitat.

The Lower Maumee River is an industrialized port with both current and historical contamination. Current land use along the Maumee River is primarily industrial and commercial. It has received historical and current contamination sources from various industries, chemical plants, petroleum production, and wastewater outfalls. Sampling by the Ohio Environmental Protection Agency (OEPA) and City of Toledo shows elevated concentrations of PCBs, PAHs, and heavy metals in surface sediments of the project area. These sediments adversely impact the survival and viability of benthic organisms and fish communities, while placing restrictions on dredging. The sediment contamination may also impact human health due to consumption of fish tainted with elevated levels of PCBs, and heavy metals. The International Joint Commission indicates in the Maumee River RAP that “heavy metals and organic chemical sediment contamination are what led to the lower Maumee River being classified as an Area of Concern” (RAPAC 1991). In 2011 and 2012, GLNPO performed a sediment assessment of the Phase 1 area of the Lower Maumee River. Results of that sampling event are presented in a *Sediment Assessment Report, Lower Maumee River, Maumee River Area*

of Concern, Toledo, Lucas County, Ohio, 2012. Sampling results indicated that PAHs and metals are of concern in the Phase 1 area.

In 2010, GLNPO performed a sediment investigation of the Duck Creek and Otter Creek confluence areas. The results showed that Duck Creek confluence area, which is adjacent to the Phase 2 Maumee project area, has high concentrations of PCBs below the sediment surface. The project area for this Phase 2 investigation encompasses the Lower Maumee River from the I-280 Bridge downstream to the Cullen Park peninsula, approximately 4.6 miles. The project area does not include any part of the U.S. Army Corp of Engineers Federal Navigation Channel, or any of the privately maintained slips near Presque Isle. The site area is also contiguous with GLNPO's Great Lakes Legacy Act Duck and Otter Creek confluence project area.

3. DATA VALIDATION

This section presents a summary of the data collected, verified, and validated during the site characterization field investigation at Lower Maumee River. Sediment was the only medium collected at the Site. Twenty-one sample delivery groups (SDGs) were reported by TestAmerica Laboratories, Inc. (TestAmerica) and submitted for data validation. All analytical laboratory data packages are located in Appendix A.

All data were verified by EA, to ensure completeness and accuracy of field chain-of-custody, laboratory electronic data deliverables (EDDs), and laboratory analytical data packages. The project goal was for data to undergo two levels of review and validation. Environmental Data Services, Inc. (EDS), located in Williamsburg, Virginia, was subcontracted by EA to perform a 100 percent Tier I and 20 percent Tier II data validation. Chicago Bridge & Iron Company's (CB&I's) Quality Assurance Technical Support Program (QATS) was subcontracted by EPA to conduct a 100 percent Tier II data validation verification check for this project. The Tier I and Tier II reviews were performed according to the *National Functional Guidelines for Superfund Organics Method Data Review* (EPA 2008) and *National Functional Guidelines for Superfund Inorganics Method Data Review* (EPA 2010).

The EDS data validation reports (DVRs) were prepared for all validations and are presented in Appendix B. Each DVR contains a comprehensive listing of samples reviewed (field sample identifications and laboratory sample numbers), validation review elements, a summary of the individual method's performance, and the sample data sheets showing data validation qualifiers (and reasons for qualification) that were applied to the sample results. Edits were not made to the laboratory's sample data sheets if the performance and quality control (QC) sample results were within laboratory or project criteria. When QC results indicated inadequate performance, validation data qualifiers were applied to the results to inform the data user of the possible performance issues identified in the DVR. These qualifiers are in addition to, or a revision of, the qualifiers provided by the laboratory. On the basis of the validations, data were: (1) accepted without qualification, (2) qualified as indicated in Table 3-1; or (3) rejected "R". The complete list of validation qualifiers applied to the results and their definitions are presented in Table 3-1. Data qualifiers were added to the results in the EDDs. The EDDs contained the original laboratory qualifiers, validation qualifiers, and data revisions.

Specifically, the items/criteria reviewed during the validation process were:

- Holding times and sample preservation
- Gas chromatography/mass spectroscopy (GC/MS) tuning
- Initial and continuing calibration and verifications
- Method blank contamination
- Surrogate spike recoveries
- Matrix spike/matrix spike duplicate (MS/MSD) recoveries
- Laboratory control sample (LCS) recoveries

- Internal standard area and retention time summary forms
- Target compound identification
- Compound quantitation
- Tentatively identified compounds
- Field duplicate sample precision
- Duplicate sample analysis
- Inductively coupled plasma (ICP) interference check sample
- ICP serial dilution
- ICP/MS tuning

CB&I's QATS was contracted by GLNPO to perform Tier 2 data validation verification on all of the data sets validated by EDS. Data validation verification was performed on 2,603 analyses, totaling 49,433 analytical results, from 409 sediment samples. Of the 49,433 analytical results, 47,914 (96.9 percent) of the original data validation results were verified to be correct. Revisions were required to the results for 1,519 of the 49,433 results (3.1 percent). The revisions included changing, adding, or removing select qualifiers from the validated data or changing the Yes to No (or vice versa) in the reportable result column. CB&I provided results of the validation verification including revised EDDs and a summary of the QATS-revised data qualifiers (Appendix C).

All revisions to the results and qualifiers superseded EDS's validation qualifiers and are considered the final validation decisions. The summary of the QATS-revised data qualifiers and justifications are provided in Table 3-2.

QATs data validation review revealed a discrepancy in the project holding time requirements for oil and grease samples. The holding time required by the QAPP/FSP (EA 2013) is 14 days from collection to extraction and 40 days to analysis. The North Canton, Ohio TestAmercia Laboratory Standard Operating Procedure (SOP) number NC-WC-091 for HEM/SGT-HEM for Methods 1664A, 9070A, and 9071B defines the holding time as 28 days from collection to analysis. Method 9071B, n-Hexane Extractable Material (HEM) for Sludge, Sediment, and Solid Samples recommends that the samples be analyzed as soon as possible. QATS validated the oil and grease samples using the 14-day QAPP/FSP (EA 2013) holding time, resulting in the qualification of 167 oil and grease sample results.

EDS validators qualified metal sample results when the associated serial dilution percent differences (%D) exceeded 10 percent. QATS validated the serial dilution samples using the expanded %D criteria of 15 percent allowed in the National Functional Guidelines. This resulted in the removal of 323 J qualifiers from affected metals results for associated serial dilution %Ds that were greater than 10 percent but less than 15 percent.

EDS validators qualified all PAH sample results associated with the deuterated monitoring compound (DMC) 4-chloroaniline-d4 as rejected R when the recovery of 4-chloroaniline-d4 was listed as zero (0) on the FORM II DMC report form. The three compounds affected were 4-chloroaniline, hexachlorocyclopentadiene, and 3,3'-dichlorobenzidine. The QATS validators

changed the qualifiers for these compounds in 148 samples from (R) rejected to (UJ) estimated because the lower acceptable limit for this DMC is so low.

4. QUALITY ASSURANCE/QUALITY CONTROL

The major components of the quality assurance/quality control (QA/QC) program included the collection and analysis of QC samples, the use of SOPs for field and laboratory activities, and data validation and verification of analytical results. The field investigation activities included collection of additional QC samples (e.g., duplicates, MS/MSD, etc.) sufficient to meet the requirements of the DQOs as defined in the QAPP/FSP (EA 2013). In order to provide adequate sample volume for sample analysis, the core intervals were adjusted. During the field investigation, seven locations were relocated, one location was removed, and two locations were added after consultation with EPA. None of the deviations identified affected the QA of this field investigation. Field and laboratory SOPs for this investigation are found in the QAPP/FSP (EA 2013). Field SOPs were followed for sample collection, handling and decontamination, and the sediment sampling conducted. Laboratory SOPs were followed for analytical testing.

This section describes the QA/QC findings for the analytical data provided by TestAmerica. EDS performed 100 percent Tier I and 20 percent Tier II validation in accordance with the protocols and QC requirements of the analytical methods, and the most recent EPA National Functional data validation guidelines identified in Section 3. EA reviewed the electronic deliverables from EDS and determined they contained suitable data validation qualifiers and accompanying case narratives and submitted to CB&I to conduct a 100 percent Tier II data validation verification. In preparing this DUAR, the available data validation reports and case narratives were reviewed from EDS and CB&I. The validation verification findings identified by CB&I were considered the final qualification of the data sets. The QC findings are summarized in the following sections and only address those issues that resulted in the qualification of data.

4.1 LABORATORY DATA

The sediment analyses were performed by TestAmerica. TestAmerica submitted analytical data reports and EDDs for validation. The analytical data reports and case narratives for the sediment samples collected at the Lower Maumee River site are contained in Appendix A. Data verification and validation procedures not outlined in National Functional Guidelines were accomplished by comparing the contents of the analytical data packages and QA/QC results to the requirements presented in the QAPP, the analytical methods and reporting requirements defined in the QAPP, and the laboratory SOPs.

The deliverables included appropriate data qualifiers and accompanying data summaries. Appendix B of this DUAR contains the DVRs from EDS, and Appendix C of this DUAR contains the verification reports from QATS. The data validation findings are summarized in the following sections. The following analyses were included in the validated data for sediment samples:

- SVOC, EPA Contract Laboratory Program (CLP) SOM01.2

- PAH 34, EPA CLP SOM01.2
- PCBS, EPA CLP SOM01.2
- Michigan Metals, EPA CLP ISM01.3
- Oil and Grease, EPA SW-846 Method 9071B
- TOC, Lloyd Kahn
- AVS/SEM.

4.1.1 Semivolatile Organic Compounds (SVOC)

4.1.1.1 Holding Times

The samples were extracted and analyzed within the required holding time except the following:

- Several samples were extracted outside holding time; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

4.1.1.2 Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning

All criteria were met.

4.1.1.3 Initial Calibration

All percent relative standard deviation (%RSD) and mean relative response factor (RRF) criteria were met except the following:

- **SDG 16999—**Low criteria for 2,4-dinitrophenol; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17010—**Low criteria for fluoranthene; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17024, 17071, 17127—**Low criteria for pentachlorophenol and pyrene; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17028—**Low criteria for pentachlorophenol, benzo(b)fluoranthene, and dibenzo(a,h)anthracene; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17054, 17055—**Low criteria for pentachlorophenol, di-n-octylphthalate, benzo(b) fluoranthene and dibenzo(a,h)anthracene; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17056, 17122—**Low criteria for benzo(b)fluoranthene and dibenzo(a,h)anthracene; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17078, 17083, 17099—**Low criteria for pentachlorophenol, pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

4.1.1.4 Continuing Calibration

All %D and RRF criteria were met except the following:

- **SDG 16948—**Low criteria for hexachlorocyclopentadiene and 2,4-dinitrophenol; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 16995, 17052, 17125—**Low criteria for pentachlorophenol and hexachlorocyclopentadiene; the affected samples results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 16999—**Low criteria for pentachlorophenol, hexachlorocyclopentadiene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene; the affected samples results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17010—**Low criteria for benzo(g,h,i)perylene, hexachlorocyclopentadiene, 4-nitrophenol, pentachlorophenol, n-nitroso-di-n-propylamine and 4-bromophenyl-phenylether , the affected sample results were qualified "JUJ".

- **SDG 17014, 17096—**Low criteria for hexachlorocyclopentadiene, 2,4-dinitrophenol, and pentachlorophenol; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17024—** Low criteria for hexachlorocyclopentadiene, 2,4-dinitrophenol, and pentachlorophenol; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17028—**Low criteria for hexachlorocyclopentadiene, 2,4-dinitrophenol, and pentachlorophenol; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17054, 17071—**Low criteria for pentachlorophenol, hexachlorocyclopentadiene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, 2, 4-dinitrophenol, and benzo(g,h,i)perylene; the affected samples results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 10755—**Low criteria for pentachlorophenol, hexachlorocyclopentadiene, 4-methylphenol, benzo(k)fluoranthene, and di-n-octylphthalate; the affected samples results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17056—**Low criteria for hexachlorocyclopentadiene, and indeno(1,2,3-cd)pyrene; the affected samples results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17061—**Low criteria for hexachlorocyclopentadiene, 2,4-dinitrophenol, benzo(k)fluoranthene, and di-n-octylphthalate; the affected samples results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17078—**Low criteria for hexachlorocyclopentadiene, pyrene, fluoranthene, benzo(g,h,i)perylene and di-n-octylphthalate; the affected samples results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17083—**Low criteria for hexachlorocyclopentadiene, pyrene, fluoranthene, benzo(g,h,i)perylene, and di-n-octylphthalate; the affected samples results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17099—**Low criteria for hexachlorocyclopentadiene, pyrene, fluoranthene, benzo(g,h,i)perylene, and di-n-octylphthalate; the affected samples results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17122—** Low criteria for hexachlorocyclopentadiene, caprolactam, and di-n-octylphthalate; the affected samples results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17127—**Low criteria for pyrene, hexachlorocyclopentadiene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene; the affected samples results were qualified "UJ" for non-detects and "J" for detects.

4.1.1.5 Method Blank Contamination

The method blanks were free of contamination with the exception of the following:

- **SDG 16948—**SBLKZ1 (butylbenzylphthalate and bis (2-ethylhexyl)phthalate) and SBLKL4 (butylbenzylphthalate, bis (2-ethylhexyl)phthalate, and di-n-octylphthalate) associated with several samples. The associated results for these samples were considered non-detected and qualified "U" or not qualified.

- **SDG 16995—**SBLKL4 (butylbenzylphthalate, bis (2-ethylhexyl) phthalate, and di-n-octylphthalate) and SBLKL8 (butylbenzylphthalate and bis (2-ethylhexyl)phthalate) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 16999—**SBLKL5 (butylbenzylphthalate and bis (2-ethylhexyl)phthalate). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17010—**SBLKL7 and SBLK10 bis (2-ethylhexyl)phthalate. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17014—**SBLKL7 and SBLKL8 (butylbenzylphthalate and bis (2-ethylhexyl)phthalate). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17024—**SBLK9L and SBLKL9 (butylbenzylphthalate and bis (2-ethylhexyl)phthalate). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17028—**SBLKM1, SBLK1M, and SBLKM1 (di-n-butylphthalate, butylbenzylphthalate and bis (2-ethylhexyl)phthalate). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17052, 17122—**SBLKM2, SBLKN8, and SBLK8N (butylbenzylphthalate and bis (2-ethylhexyl) phthalate). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17054—**SBLKM7 (phenol, acetophenone, di-n-butylphthalate , butylbenzylphthalate and bis (2-ethylhexyl)phthalate). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17055, 17056, 17096—**SBLKL8, SBLKL9, SBLKN6 and SBLKN1 (butylbenzylphthalate, di-n-butylphthalate , and bis (2-ethylhexyl) phthalate). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17061—**SBLKM5 and SBLKM9 (di-n-butylphthalate, butylbenzylphthalate and bis(2-ethylhexyl)phthalate). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17071—**SBLKN2 and SBLKN7 (butylbenzylphthalate, di-n-butylphthalate , and bis(2-ethylhexyl)phthalate). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17078—**SBLKN2 and SBLKN3 (butylbenzylphthalate, di-n-butylphthalate , acetophenone and bis (2-ethylhexyl)phthalate). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17083—**SBLKN4, SBLK7N and SBLKN7 (butylbenzylphthalate, di-n-butylphthalate , acetophenone and bis (2-ethylhexyl) phthalate, naphthalene). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17099—**SBLKN5, SBLK5N and SBLKNN (butylbenzylphthalate, di-n-butylphthalate , acetophenone and bis (2-ethylhexyl)phthalate, naphthalene). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17127—**SBLKN9 and SBLK9N (butylbenzylphthalate, di-n-butylphthalate , acetophenone and bis (2-ethylhexyl)phthalate, naphthalene). The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17149—**SBLKN9 and SBLK9N (butylbenzylphthalate, di-n-butylphthalate , acetophenone and bis (2-ethylhexyl)phthalate, naphthalene). The associated results for these samples were considered non-detected and qualified "U".

4.1.1.6 Surrogate Spike Recoveries

All samples exhibited acceptable surrogate percent recovery (%R) values with the exception of the following:

- Several samples were rejected due to low surrogate recoveries of 4-chloroaniline-d4 by EDS. During the QATs Tier 2 validation review, the qualifiers were replaced with a "U" or "UJ" for non-detects or "J" for detects due to the low the acceptance criteria, or the surrogate was diluted out.

- **SDG 16948, SDG 16995—**High phenol-d5 recovery in several samples. The associated results for this compound were considered estimated and qualified "J".

- **SDG 16999, 17056, 17061, 17078—**High phenol-d5 and 4-methylphenol-d8 recovery in several samples. The associated results for this compound were considered estimated and qualified "J".

- **SDG 17010, 17014, 17028, 17052, 17055, 17071, 17083, 17099, 17122, 17125, 17127—** Several surrogates exhibited high recovery in several samples. The associated results for this compound were considered estimated and qualified "J".

4.1.1.7 Matrix Spikes/Matrix Spike Duplicate (MS/MSD) Recoveries

All MS/MSD samples analyzed exhibited acceptable %R and relative percent difference (RPD) values except the following:

- **SDG 16999—**High pyrene recovery; the associated sample results for this compound were considered estimated and qualified "J".

4.1.1.8 Laboratory Control Sample (LCS) Recoveries

All LCS samples exhibited acceptable %R values.

4.1.1.9 Internal Standard (IS) Area Performance

All internal standards met response and retention time (RT) criteria except the following:

- **SDG 17010, 17071, 17122—**Low perylene-d12 RT; the associated sample results for this compound were considered estimated and qualified "UJ" for non-detects and "J" for detects.

- **SDG 17014—**Low chrysene-d12 and perylene-d12 RT; the associated sample results for this compound were considered estimated and qualified "UJ" for non-detects and "J" for detects.

- **SDG 17024—**Low phenanthrene-d10, acenaphthalene-d10, and perylene-d12 RT; the associated sample results for this compound were considered estimated and qualified "UJ" for non-detects and "J" for detects.

- **SDG 17078—**Low phenanthrene-d10; the associated sample results for this compound were considered estimated and qualified "UJ" for non-detects and "J" for detects.

- **SDG 17099—**Low chrysene-d12 and perylene-d12 RT, and high 1,4-dichlorobenzene-d4, Naphthalene-d8, Acenaphthalene-d10; the associated sample results for this compound were considered estimated and qualified "UJ" for non-detects and "J" for detects.

4.1.1.10 Target Compound Identification

All mass spectra and quantitation criteria were met.

4.1.1.11 Compound Quantitation

All criteria were met except the following:

- Several samples were analyzed at various dilutions due to high concentrations of target compounds.

4.1.1.12 Field Duplicate Sample Precision

Field duplicate results exhibited acceptable RPD.

4.1.2 Polycyclic Aromatic Hydrocarbons (34 PAHs)

4.1.2.1 Holding Times

The samples were extracted and analyzed within the required holding time except the following:

- **SDG 17071, 17127—**Several samples were extracted outside holding time, the affected sample results were qualified "UJ" for non-detects and "J" for detects.

4.1.2.2 Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning

All criteria were met.

4.1.2.3 Initial Calibration

All %RSD and mean RRF criteria were met.

4.1.2.4 Continuing Calibration

All %D and RRF criteria were met except the following:

- **SDG 16995, 16999, 17010, 17014, 17096—**Low criteria for dibenzo(a,h)anthracene; the affected sample results were qualified "UJ" for non-detects and "J" for detects.

- **SDG 17056—**Low criteria for benzo(g,h,i)perylene; the affected samples results were qualified "UJ" for non-detects and "J" for detects.

4.1.2.5 Method Blank Contamination

The method blanks were free of contamination with the exception of the following:

- **SDG 16999—**SBLKZ5 (naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17010 —**SBLKM3 (naphthalene, 2-methylnaphthalene, and phenanthrene) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17014, 17028, 17052, 17078—**SBLKL7, SBLKL8, SBLKM, SBLKM2, and SBLKN3 (naphthalene) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17024, 17056—**SBLKL9 and SBLKN1 (naphthalene and 2-methylnaphthalene) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17054, 17096—**SBLKM7 and SBLKN6 (several compounds) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17071—**SBLKN2 and SBLKN2 (naphthalene, indeno(1,2,3-cd)pyrene and benzo(g,h,i)perylene) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17083—**SBLKN4 (1-methylnaphthalene) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17122—**SBLKN8 (2-methylnaphthalene) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17125—**SBLK01 (2-methylnaphthalene) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17127—**SBLKZ5 (naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

4.1.2.6 Surrogate Spike Recoveries

- **SDG 16995—**All samples exhibited acceptable surrogate %R values except several samples where the surrogate was diluted out. No additional qualifiers were applied.

4.1.2.7 Matrix Spikes/Matrix Spike Duplicate (MS/MSD) Recoveries

All MS/MSD samples analyzed exhibited acceptable %R and RPD values.

4.1.2.8 Laboratory Control Sample (LCS) Recoveries

All LCS samples exhibited acceptable %R values.

4.1.2.9 Internal Standard (IS) Area Performance

All internal standards met response and RT criteria except the following:

- **SDG 17096—**High chrysene-d12. The associated results for these samples were considered estimated and qualified "J".

4.1.2.10 Target Compound Identification

All mass spectra and quantitation criteria were met.

4.1.2.11 Compound Quantitation

All criteria were met except the following:

- Several samples were analyzed at various dilutions due to high concentrations of several target compounds and were flagged "E" by the laboratory which were qualified estimated "J" by the validator.

4.1.2.12 Field Duplicate Sample Precision

Field duplicate results exhibited acceptable RPD values.

4.1.3 Polychlorinated Biphenyls (PCBs)

4.1.3.1 Holding Times

The samples were extracted and analyzed within the required holding time.

4.1.3.2 Initial Calibration

All %RSD were met.

4.1.3.3 Continuing Calibration

All %D criteria were met.

4.1.3.4 Method Blank

The method blanks were free of contamination.

4.1.3.5 Surrogate Spike Recoveries

All samples exhibited acceptable surrogate %R values with the exception of the following:

- **SDG 16995, 16999, 17010, 17024, 17028—**Low decachlorobiphenyl and tetrachloro-m-xylene recovery in several samples. The associated results for this compound were considered estimated; with positive results qualified "J" and non-detected results qualified "UJ".

4.1.3.6 Matrix Spikes/Matrix Spike Duplicate (MS/MSD) Recoveries

All MS/MSD samples analyzed exhibited acceptable %R and RPD values.

4.1.3.7 Laboratory Control Sample (LCS) Recoveries

All LCS samples exhibited acceptable %R values.

4.1.3.8 Compound Quantitation

- **SDG 16995, 16999, 17010, 17014, 17024—**Several samples exhibited high concentrations of PCBs and were flagged (E) by the laboratory. The samples were diluted and reanalyzed within holding time. The diluted results were reported.

4.1.3.9 Field Duplicate Sample Precision

Field duplicate results exhibited acceptable RPD values.

4.1.3.10 Gas Chromatography (GC) Column Difference Results

- Several samples exhibited high %D values > 25 percent between column. The associated results were qualified as estimated "J".

4.1.4 Metals and Mercury

4.1.4.1 Holding Times

The samples were prepared and analyzed within the required holding time.

4.1.4.2 Inductively Coupled Plasma (ICP)/Mass Spectroscopy (MS) Tuning

All criteria were met.

4.1.4.3 Initial Calibration Verification

All initial calibration criteria were met.

4.1.4.4 Continuing Calibration Verification

All continuing calibration criteria were met.

4.1.4.5 Method Blank Contamination

The method blanks were free of contamination with the exception of the following:

- **SDG 17028, 17055, 17056, 17083**—MB (cadmium and mercury), and PBS (mercury) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17014, 17052**—Trace levels of cadmium were detected in the initial calibration blank and continuing calibration blanks between the method detection limit (MDL) and contract-required quantitation limit (CRQL). The results of the affected samples were

adjusted to the CRQL and qualified "U". The J qualifier was added for the serial dilution exceeding criteria.

4.1.4.6 Inductively Coupled Plasma (ICP) Interference Check Sample

The ICP interference check sample exhibited acceptable %R values.

4.1.4.7 Laboratory Control Sample (LCS) Recoveries

All LCS samples exhibited acceptable recoveries.

4.1.4.8 Matrix Spikes/Duplicate (MS/DUP) Recoveries

All MS/DUP samples analyzed exhibited acceptable %R and RPD values except the following:

- **SDG 16948, 17055, 17061, 17127—**There was high mercury recovery. The associated results for these samples were considered estimated and qualified "J".

- **SDG 17028—**There were high lead and mercury recoveries. The associated results for these samples were considered estimated and qualified "J".

- **SDG 17054—**There was high lead recovery. The associated results for these samples were considered estimated and qualified "J".

- **SDG 17083—**There were high arsenic and cadmium recoveries. The associated results for these samples were considered estimated; with positive results qualified "J" and non-detected results qualified "UJ".

- **SDG 17099—**There was high arsenic recovery. The associated results for these samples were considered estimated and qualified "J".

4.1.4.9 Inductively Coupled Plasma (ICP) Serial Dilution

ICP serial dilution %D were within acceptable limits except the following:

- **SDG 16948, 17099**—There were low nickel and zinc recoveries. The associated results for these samples were considered estimated and qualified "J".

- **SDG 16995, 17028, 17078**—There was low nickel recovery. The associated results for these samples were considered estimated and qualified "J".

- **SDG 16999, 17010, 1714**9—There were low chromium, nickel, and zinc recoveries. The associated results for these samples were considered estimated and qualified "J".

- **SDG 17014, 17125**—There were low cadmium, chromium, nickel, and zinc recoveries. The associated results for these samples were considered estimated and qualified "J".

- **SDG 17024, 17054**—There were low chromium and zinc recoveries. The associated results for these samples were considered estimated and qualified "J".

- **SDG 17052, 17055, 17071**—There were low chromium, copper, nickel, and zinc recoveries. The associated results for these samples were considered estimated and qualified "J".

- **SDG 17056**—There was low chromium recovery. The associated results for these samples were considered estimated and qualified "J".

- **SDG 17061, 17122**—There were low cadmium, chromium, copper, nickel, and zinc recoveries. The associated results for these samples were considered estimated and qualified "J".

- **SDG 17083**—There were low chromium, lead, nickel, and zinc recoveries. The associated results for these samples were considered estimated and qualified "J".

- **SDG 17096**—There were low arsenic, cadmium, chromium, copper, lead, nickel, and zinc recoveries. The associated results for these samples were considered estimated and qualified "J".

- **SDG 17127—**There were low arsenic, chromium, copper, nickel, and zinc recoveries. The associated results for these samples were considered estimated and qualified "J".

4.1.4.10 Compound Quantitation

All criteria were met.

4.1.4.11 Field Duplicate Sample Precision

Field duplicate results exhibited acceptable RPD values.

4.1.5 Oil and Grease, Total Organic Carbon (TOC), and Acid Volatile Sulfide (AVS)/Simultaneously Extracted Metals (SEM)

4.1.5.1 Holding Times

The samples were analyzed within the required holding time for each analysis except the following:

- **SDG 17054, 17055, 17061, 17071, 17078, 17083, 17096, 17099, 17122, 17125, 17127, 17149**—TOC holding times for several samples. The associated results for these samples were considered estimated and qualified "J".

- **SDG 17010, 17014, 17055, 17061, 17071, 17083, 17096, 17099, 17122, 17125, 17127, 17149**—Oil and grease holding times for several samples. The associated results for these samples were considered estimated and qualified "J" for detects and "UJ" for non-detects.

4.1.5.2 Initial and Continuing Calibration

All %R criteria were met.

4.1.5.3 Method Blank Contamination

The method blanks were free of contamination with the exception of the following:

- **SDG 16948, 16995, 16999, 17010, 17014, 17024, 17028, 17055, 17071, 17083, 17096, 17125, 17127**—MB 240-89836/1-A, MB 240-91121/1-A, MB 240-90545/1-A, MB 240-91726/1-A, MB 240-90718/1-A, MB 240-92349, MB 240-92537/1-A, MB 240-92706/1-A, MB 240-93562/1-A, and MB 240-91908/1- (Oil and Grease) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

- **SDG 17061, 17078**—MB 180-76255/1-A (Oil and Grease) associated with several samples. The associated results for these samples were considered non-detected and qualified "U".

4.1.5.4 Laboratory Control Sample (LCS) Recoveries

All LCS samples exhibited acceptable %R values.

4.1.5.5 Matrix Spikes/Duplicate (MS/DUP) Recoveries

- **SDG 16995, 17054, 17096, 17125—**All MS/DUP samples analyzed exhibited acceptable %R and RPD values except high oil and grease recovery. The associated results for this compound were considered estimated, with positive results qualified "J" and non-detected results qualified "UJ".

- **SDG 17028, 17052, 17056, 17078, 17099, 17122, 17125—**All MS/DUP samples analyzed exhibited acceptable %R and RPD values except low oil and grease recovery. The associated results for this compound were considered estimated, with positive results qualified "J" and non-detected results qualified "UJ".

- **SDG 17071—**All MS/DUP samples analyzed exhibited acceptable %R and RPD values except the high mercury SEM %R. The associated results for this compound were considered estimated and qualified "J".

4.1.5.6 Compound Quantitation

All criteria were met.

4.1.5.7 Field Duplicate Sample Precision

Field duplicate results exhibited acceptable RPD values.

5. DATA USABILITY ASSESSMENT

Data usability assessment is the process of evaluating validated and verified data to determine whether they can be used for the purpose of the project (e.g., to answer the environmental questions or to make the environmental decision that must be made).

The data were evaluated for acceptable quality and quantity based on the critical indicator parameters, represented by precision, accuracy, representativeness, completeness, comparability, and sensitivity (PARCCS). To the extent possible, EA followed EPA's data quality assessment process (EPA 2006). This evaluation helps determine whether limitations should be placed on the data and to verify that the type, quality, and quantity of data that are collected are appropriate for their intended use. The PARCCS parameters were reviewed for the laboratory analytical data results and are discussed in the following sections.

A well-defined QA/QC process is integral to the generation of analytical data of known and documented quality. The QC process includes those activities required during data collection to produce data of sufficient quality to support the decisions that will be made based on the data (e.g., decisions to be made prior to, during, and after site remedial actions). After environmental data are collected, QA activities focus on evaluating the quality of the data in order to determine the data usability with respect to support for remedial or enforcement decisions.

All analytical data, data validation qualifiers, and QC results were evaluated to determine the confidence with which the sediment data could be used in the site characterization assessment of the Site. The criteria used in the data usability assessment are presented in the following sections.

5.1 DATA QUALITY OBJECTIVES

The overall DQO for the project was to provide data of known and documented quality to characterize current site conditions at the Site.

The primary objectives of this task order for the Lower Maumee River site characterization assessment are: (1) define the nature and extent of chemical contamination in the areas of soft sediment deposition, including depth of contamination, provide information about depositional areas, and identify high priority areas for remediation or for further investigation; (2) develop preliminary estimates for the volume of soft sediment in these areas; (3) identify hotspots; and (4) identify potential sources of contamination.

5.2 LABORATORY ACCREDITATION

The samples were analyzed by TestAmerica, a National Environmental Laboratory Accreditation Conference (NELAC) certified lab. TestAmerica was procured by EA using the procurement procedures outlined in the EA Quality Management Plan for the Great Lakes Architect-Engineer

Services (GLAES) program to perform the required analytical services work in accordance with the overall GLAES contract and Task Order-specific quality.

5.3 ANALYTICAL METHODS

The sediment samples were analyzed by TestAmerica's laboratories located in Burlington, Vermont; North Canton, Ohio; and Pittsburgh, Pennsylvania for this investigation. The analytical methods used are presented in Section 4.1 of this DUAR. No deviations were identified in the laboratory analysis reports or in the DVRs for the approved methods; therefore, the DQO for analytical methods was met.

5.4 SAMPLING HANDLING AND CHAIN-OF-CUSTODY

Sample handling chain-of-custody (COC) procedures followed the procedures outlined in the QAPP/FSP (EA 2013). Sediment samples were submitted for analysis to the TestAmerica Burlington laboratory and the TestAmerica North Canton laboratory. Samples were placed in the appropriate sample containers (obtained from TestAmerica), preserved, and labeled in accordance with the QAPP/FSP (EA 2013). In preparation for shipment to the laboratories, all samples were packaged in accordance with the general procedures outlined in the QAPP/FSP (EA 2013). A COC form was completed and accompanied each cooler. Copies of the completed COCs are provided in the analytical laboratory reports. All samples were received by the laboratory intact, properly preserved, and under a proper COC.

5.5 DATA VALIDATION

Data validation consists of evaluating the completeness, correctness, and conformance of a data set against the method, SOP, or contract requirements documented in the approved QAPP/FSP (EA 2013). The levels of data review and validation were consistent with the requirements of the QAPP/FSP (EA 2013). The DVRs and data validation verification reports are presented in Appendix B and Appendix C, respectively.

The data review and validation achieved the project goals. The overall data review and validation program attained the project objectives with no adverse effects on data quality or usability.

5.6 DATA QUALITY INDICATORS

The type of data generated depends on the qualitative and quantitative DQOs developed for a project. Data analyzed must be of adequate quality for the decision-making process for which they were collected. For this project, both field-based and analytical data may be used to support decisions made for this project. EPA CLP analytical methods were used to generate analyte-specific, definitive data for this project. The definitive quality of the data is assured by: (1) using SOPs and QC processes during data collection; (2) documented control and traceability of reference standards, calibrations, and instrument performance; and (3) acceptable performance

of field and laboratory QC procedures within the defined limits established for these procedures. Both quantitative and qualitative quality indicators defined in terms of precision, accuracy, representativeness, completeness, and comparability are used to assess the quality of a data set. Three of these parameters can be quantified: precision, accuracy, and completeness. Representativeness and comparability are qualitative descriptors of data integrity. Sensitivity is evaluated by direct comparison of project quantitation limits to screening criteria.

5.6.1 Precision

Precision describes the reproducibility of measurements of the same parameter for a sample under the same or similar conditions. Specifically, it is a quantitative measure of the degree of variability of a group of measurements compared to the average value. Precision is evaluated most directly by recording and comparing multiple measurements of the same parameter made on the same sample under similar conditions. Standard deviation, coefficient of variation, range, and relative range are terms often used to express precision. Precision is determined in the laboratory by assessing the RPD for sample duplicate and MS/MSD pairs:

$$RPD = \frac{\text{Sample result} - \text{Duplicate result}}{(\text{Sample result} + \text{Duplicate result})/2} \times 100$$

Given uncertainties associated with field work and laboratory activity, a precision of ±30 percent RPD is the DQO to meet the project objectives.

The acceptance criteria for each analytical methodology are presented in the QAPP (EA 2013). Duplicate results were evaluated for compliance with acceptance criteria for precision for each analytical method. RPD evaluations are documented in the individual data validation report for each SDG which was validated for MS/MSD and laboratory replicate pairs.

Field duplicate pairs were collected, analyzed, and evaluated for each matrix. The frequency of field duplicates submitted to the laboratory for analysis was sampled in accordance with the QAPP/FSP (EA 2013) achieving the defined precision.

5.6.2 Accuracy

Accuracy is the comparison between experimental and known or calculated values, expressed as a %R, and measures the bias of a measurement system. Percent recoveries are derived from analysis of standards spiked into deionized water (standard recovery) or into actual samples (matrix spike or surrogate spike recovery). Recovery is calculated as follows:

$$\text{Accuracy} = \frac{\text{Measured Value}}{\text{True value}} \times 100 = \%R$$

Variations in accuracy result from a combination of the random error (precision) and systematic error (bias), which are due to sampling and analytical operations. Sources of error include the sampling process, field contamination, preservation, handling, sample matrix, sample preparation, and analytical techniques. However, blank contamination can directly impact the accuracy of measurements. Consequently, if contaminants of potential concern are detected in the field blanks (but not in the laboratory blanks) at concentrations at or near the project action levels, then selective re-sampling should be considered.

Acceptance of the calibration is usually within 10 percent of the true value, but this varies with the value being measured and the instrument being calibrated. Refer to the SOPs presented in Appendix B of the FSP.

Laboratory accuracy was assessed through the analysis of MS/MSDs, LCSs, and surrogate spikes as appropriate to each method. Percent recovery in these samples is evaluated by analyzing a spiked and an un-spiked portion of the same investigative sample. The spike recovery is calculated using the following equation:

$$\%R = \frac{\text{Observed spike sample conc. - Unspiked sample conc.}}{\text{True concentration of spike}} \times 100$$

One field sample in every 20 was marked as an MS/MSD sample. The level of recovery of an analyte in MS/MSD samples is dependent on the sample matrix, the method of analysis, and the contaminant. The concentration of the analyte relative to the detection limit of the method is also a factor. MS/MSD samples and samples spiked with surrogates, compounds similar to environmental contaminants but not likely to be present in the samples, are used to evaluate the effect of the sample matrix on the accuracy of the analytical data.

LCS and laboratory control spike duplicate (LCSD) samples were prepared and analyzed along with the investigative samples. LCS/LCSD samples consist of a clean matrix that is spiked with known constituents and are indicative of the accuracy of the laboratory techniques without possible sample matrix interferences. Recovery for MS/MSD and LCS/LCSD samples will meet the compound-specific laboratory accuracy limits.

MS and MSD samples were prepared and analyzed at a frequency of 5 percent. LCSs or blank spikes are also analyzed at a frequency of 5 percent. Surrogate standards, where applicable, are added to every sample analyzed for organic constituents. The results of the spiked samples are used to calculate the percent recovery for evaluating accuracy. The evaluations of percent recovery are documented in Appendix B and Appendix C.

$$\text{Percent Recovery} = \frac{S - C}{T} \times 100\%$$

where: S = measured spike sample concentration
C = sample concentration
T = true or actual concentration of the spike

The objective for accuracy of field measurements is to achieve and maintain factory specifications for the field equipment. To this end, appropriate SOPs for instrument calibration were followed and calibration results were properly documented.

Representativeness

Representativeness describes the degree to which sample data accurately and precisely represent a characteristic of the material being measured. Representativeness is a qualitative term that is evaluated to determine whether *in situ* and other field measurements are made and physical samples are collected in such a manner that the resulting data appropriately reflect the media and phenomenon measured or studied.

Sample results were evaluated for representativeness by examining items related to sample collection, including COC documentation, sample labeling, collection dates, and condition of the samples upon receipt at the laboratory. Laboratory procedures (including anomalies reported by the laboratory) were also examined, either upon receipt of the samples at the laboratory or during analytical processes. Procedures that were examined included adherence to recommended holding times of samples prior to analysis; calibration of laboratory instruments; adherence to analytical methods; and completeness of data package documentation. Any item that may have adversely affected the representativeness of the sample result is documented in the data validation narratives.

Some of the samples were extracted and analyzed outside the holding times for SVOCs, PAHs TOC and oil and grease. The affected sample results were qualified as estimated “J” or “UJ”; however, no results were rejected based on holding time issues. Calibration blanks, and preparation blank results were evaluated during the data validation or review process to determine whether laboratory conditions (preparation or calibration blanks) affected sample results. As necessary appropriate qualifiers were applied by the data validator or verifier.

The field investigation program, outlined in the QAPP/FSP (EA 2013), was designed to answer the principal goals of the study from the DQO process. Therefore, it is important that the data collected during the field investigation is suitable and sufficient to accomplish the DQOs. To satisfy these sampling goals, sediment samples were collected from the defined project area for chemical and physical analyses to evaluate the current conditions of the Lower Maumee River. Based on the information collected during the site reconnaissance, targeted station locations were adjusted to ensure that samples were collected outside of dredged areas and in locations not within or adjacent to utility crossings. To define the extent of contamination and evaluate

sediment thickness, sampling locations were spatially distributed based on site conditions. The representativeness goal for this project has been achieved.

5.6.3 Completeness

Completeness is defined as the percentage of measurements judged to be valid. The validity of sample results is determined through the data validation process. The rejected (R) sample results are considered to be incomplete. The data that are qualified as estimated (J) or estimated non-detected (UJ) are considered to be valid and usable. The completeness is calculated and reported for each method and analyte combination. The number of valid results divided by the number of possible individual analyte results, expressed as a percentage, determines the completeness of the data set. Completeness is expressed as a percentage, as follows:

Percent Completeness = (Number of valid data/Expected number of data) x 100

A total of three target analyte results were rejected out of 49,433 results, resulting in 99.9 percent completeness for the overall project, which exceeded the completeness goal of 90 percent. Rejected data were not used in the decision-making process for this project. A total of 409 sediment samples were collected and analyzed, meeting the goal to not to exceed 420 samples as stated in the QAPP/FSP (EA 2013). The sampling deviations that occurred did not impact DOQs for this field investigation. The data reported are suitable for their intended use. The percent completeness was acceptable to support the decision-making process and reporting activities of this investigation.

5.6.4 Comparability

Comparability of the data is a qualitative parameter that expresses the confidence with which one data set may be compared to another. Comparability of the data is achieved by using standard methods for sampling and analysis, reporting data in standard units, normalizing results to standard conditions, and using standardized reporting formats and data validation procedures.

To ensure that data derived from this field effort are comparable, all like media samples were submitted for analysis by the same analytical method (with like analytical parameters and similar detection/reporting limits); units of measure (e.g., microgram per liter, microgram per kilogram) are the same for all reporting; and like media were sampled, handled, and prepared in the same manner according to EA's field collection SOPs included in Appendix B of the QAPP/FSP (EA 2013).

5.6.5 Sensitivity

Sensitivity is a measure of method performance in terms of the ability to detect chemicals of concern at low enough concentrations to eliminate potential false negatives and to ensure the project goals in terms of actionable concentrations are met. Target detection limits are based on

available standard methods applicable to media and are below most applicable regulatory screening criteria.

Ideally the lowest of the detection limits outlined by the laboratories would be below the applicable screening level; analytically achievable quantitation limits are not always low enough to meet this goal. Specific analytes with detection limits above the screening levels were discussed in the QAPP (EA 2013). The method reporting limits were sufficient to meet the project objectives.

5.7 DETECTION AND QUANTITATION LIMITS

The analytical parameters and their quantitation limits for use on this project are determined under the EPA CLP Statement(s) of Work. The contract-required detection limit (CRDL) is the minimum concentration of an analyte that can be reliably distinguished from background noise for a specific analytical method. The quantitation limit represents the lowest concentration of an analyte that can be accurately and reproducibly quantified in a sample matrix. CRQLs are contractually specified maximum quantitation limits for specific analytical methods and sample matrices, such as soil or water, and are typically several times the MDL to allow for matrix effects.

For this project, analytical methods were selected so that the CRQL for each target analyte was below the applicable screening level and/or specific project requirements, wherever practical. For this project, sample results were reported as estimated values if concentrations were less than CRQLs but greater than MDL. The CRDL for each analyte was listed as the detection limit in the laboratory's EDD.

6. DATA QUALITY OBJECTIVES AND CONCLUSIONS

Based on the data validation findings summarized in Section 4, data were either determined to be usable or qualified as estimated. Three SVOC target analyte results were rejected in sample LMR13-65-048.

The overall DQO for the project is to provide data of known and documented quality to characterize current site conditions. The following items were evaluated to conduct an overall review of the results presented within this DUAR.

6.1 CONTAMINANTS OF CONCERN TARGETED

The DQOs identified in the QAPP/FSP (EA 2013) for the Site were based on operational history and existing site data. These data were all considered in development of the field investigation and site characterization. The target chemicals of concern were appropriately targeted and analyzed in the field investigation.

6.2 MEDIA VARIABILITY

The media of concern at the Site were sediments.

Field QC samples including field duplicates and MS/MSD samples were collected and analyzed to assess the quality and representativeness of the field sampling activities and the precision and accuracy of the analytical results.

6.3 LABORATORY PERFORMANCE PROBLEMS

In general, the laboratory performance met QC limits. Refer to Section 4 for a more detailed discussion of any laboratory performance issues.

6.4 CONCLUSIONS

For this data usability assessment, 21 SDGs were reviewed. Samples were collected and analyzed in accordance with the QAPP/FSP (EA 2013). The data were obtained using approved methods and procedures and the data met the DQOs developed for this investigation. The analytical results for this sampling event met overall project objectives for the quantity and quality of data required to support the decision-making process and reporting activities of this investigation.

Data without qualifiers and data qualified as estimated are usable for purposes in supporting project objectives with the exception of three SVOC analytes that were rejected for one sediment sample. Validated data were also found to be representative and comparable for all samples. Precision and accuracy were acceptable.

Tables

Table 3-1. Data Validation Qualifiers

Qualifier	Definition
Data Qualifier Definitions	
U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	the approximate concentration of the analyte in the sample (due to either the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
UJ	The reporting limit is approximate and may be inaccurate or imprecise.
J-	Low biased. Actual concentration may be higher than the concentration reported.
J+	High biased. Actual concentration may be lower than the concentration reported.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample
NJ	The analysis indicates the presence of an analyte that has been “tentatively identified” and the associated numerical value represents its approximate concentration.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
16948 METALS	Chromium	J	None	LMR13-05-012 LMR13-09-012 LMR13-10-012 LMR13-17-012 LMR13-23-012 LMR13-06-012 LMR13-18-012 LMR13-19-012 LMR13-19-012FD LMR13-20-012 LMR13-02-012 LMR13-02-012FD LMR13-11-012 LMR13-12-012 LMR13-16-012 LMR13-24-012	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
16948 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-12-012 LMR13-18-012 LMR13-19-012 LMR13-20-012	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
16948 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-09-012 LMR13-17-012 LMR13-06-012 LMR13-19-012	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
16948 OIL AND GREASE	HEM	J UJ	None U	LMR13-20-012 LMR13-20-012FD	The original validators did not use the actual field duplicate (FD) value of 402 mg/kg for this sample to calculate the HEM %RPD for LMR13- 20-012 field duplicate analysis; instead they compared a non-detected value assigned due to blank contamination which resulted in an RPD of 200%. Since the 402 mg/kg value is over the CRQL of 200 mg/kg, QATS used this value to calculate an RPD of 43.4%. The J qualifier for LMR13-20-012 and the J added to the U qualifier for LMR13-20- 012FD were removed.
16995 METALS	Cadmium Chromium Zinc	J	None	LMR13-42-012 LMR13-42-024 LMR13-42-048 LMR13-42-072 LMR13-42-096 LMR13-43-012 LMR13-43-024 LMR13-43-024FD LMR13-43-048 LMR13-43-096 LMR13-44-012	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
16995 METALS	Copper	J	None	LMR13-42-120 LMR13-43-072 LMR13-43-120 LMR13-44-024 LMR13-44-048 LMR13-44-048FD	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
16995 AROCLOR	Aroclor-1254	None	J	LMR13-43-024FD	The original validators did not qualify the Aroclor-1254 result for the DCB failure due to the 5x dilution. The result was J-qualified by QATS due to the low dilution factor and DCB %R failure in the original analysis.
16995 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-42-024 LMR13-42-024FD LMR13-43-096 LMR13-43-120	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
16995 PAH	Hexachlorocyclopentadiene	U	UJ	LMR13-42-096 LMR13-43-024 LMR13-43-048 LMR13-43-120 LMR13-44-024FD	The original validators did not qualify all of the associated samples for the hexachlorocyclopentadiene closing CCV %D failure.
16995 PAH	Anthracene Phenanthrene	None	J	LMR13-42-096	Four DMC percent recoveries for sample LMR13-42-096 exceeded the upper control limits. The sample was analyzed at a 2.5x dilution. Detected results were qualified J due to the high percent recoveries.
16995 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-44-024 LMR13-44-048	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
16995 OIL AND GREASE	HEM	U	J	LMR13-44-024 LMR13-44-024FD	Trace levels of HEM were detected in two of the three method blanks. The original validators incorrectly qualified two samples in the batch that was associated with the clean blank. The U qualifiers were removed from the two samples and the results returned to the original value with the original J qualifier.
16999 METALS	Copper	J	None	LMR13-44-072 LMR13-44-096 LMR13-46-012 LMR13-46-024 LMR13-46-048 LMR13-46-072 LMR13-46-096 LMR13-46-120 LMR13-81-012 LMR13-81-024 LMR13-81-048 LMR13-81-072 LMR13-81-096 LMR13-81-120	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
16999 MERCURY	Mercury	J	U	LMR13-44-072 LMR13-44-096	Trace level of mercury between the MDL and CRQL was detected in the CCB. The original validation did not report or qualify for the calibration blank contamination. The results for two samples have been adjusted to the CRQL and qualified "U".
16999 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-44-072 LMR13-44-096	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
16999 PAH	Pentachlorophenol	U	UJ	LMR13-46-120	The original validators did not report or qualify the associated sample for the pentachlorophenol closing CCV %D failure.
16999 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-81-012FD	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
16999 PAH SIM	Fluorene Anthracene Benzo(b)fluoranthene Benzo(k)fluoranthene Benzo(e)pyrene Perylene Indeno (1,2,3-cd)pyrene Benzo(g,h,i)perylene	None	J	LMR13-81-012	The dilution for LMR13-81-012 was analyzed 41 days after extraction, which exceeds the analysis holding time by 1 day. Compounds reported from the diluted sample were qualified J.
16999 PAH SIM	Fluorene Acenaphthene Anthracene Benzo(b)fluoranthene Benzo(k)fluoranthene Benzo(e)pyrene Benzo(a)pyrene Perylene Indeno (1,2,3-cd)pyrene Benzo(g,h,i)perylene	None	J	LMR13-81-012FD	The dilution for LMR13-81-012FD was analyzed 41 days after extraction, which exceeds the analysis holding time by 1 day. Compounds reported from the diluted sample were qualified J.
17010 METALS	Copper	J	None	LMR13-93-012 LMR13-93-024 LMR13-93-048 LMR13-93-072 LMR13-93-096 LMR13-93-120 LMR13-62-024FD LMR13-90-024FD LMR13-62-024 LMR13-90-012 LMR13-90-024 LMR13-90-048 LMR13-90-072 LMR13-62-012 LMR13-62-048 LMR13-62-072 LMR13-62-096 LMR13-91-024 LMR13-91-048 LMR13-47-012 LMR13-91-012	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17010 PAH	4-Chlorophenyl-phenlyether	U	UJ	LMR13-93-012 LMR13-93-024 LMR13-93-048 LMR13-93-072 LMR13-93-096 LMR13-93-120 LMR13-62-024 LMR13-90-012 LMR13-90-024 LMR13-90-048 LMR13-90-072 LMR13-62-012 LMR13-62-048 LMR13-62-072 LMR13-62-096 LMR13-91-024 LMR13-91-048 LMR13-47-012 LMR13-91-012 LMR13-90-048FD LMR13-90-012FD LMR13-93-024FD	The original validators did not report or qualify the associated samples for the initial calibration %RSD failures.
17010 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-93-096 LMR13-62-024 LMR13-90-012 LMR13-90-048 LMR13-62-048 LMR13-62-096 LMR13-91-048 LMR13-47-012 LMR13-91-012 LMR13-90-012FD	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17010 PAH SIM	Phenanthrene Fluoranthene Pyrene Benzo(a)anthracene Chrysene Benzo(b)fluoranthene Benzo(k)fluoranthene Benzo(e)pyrene Benzo(a)pyrene Perylene	None	J	LMR13-90-012FD	The sample was analyzed 41 days after extraction, which exceeds the analysis holding time by 1 day. Detected compounds reported from this sample were qualified J.
17010 PAH SIM	Naphthalene C1 Naphthalenes C1 Fluorenes	U	UJ	LMR13-90-012FD	The sample was analyzed 41 days after extraction, which exceeds the analysis holding time by 1 day. Non-detected compounds reported from this sample were qualified UJ.
17010 OIL AND GREASE	HEM	U	UJ	LMR13-62-072 LMR13-91-024 LMR13-91-048 LMR13-91-012 LMR13-91-024FD	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The non-detect samples were qualified UJ.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17010 OIL AND GREASE	HEM	None	J	LMR13-47-012 LMR13-90-048FD LMR13-93-024FD	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The detect samples were qualified J.
17014 METALS	Cadmium	J	UJ	LMR13-51-024FD LMR13-51-024 LMR13-51-048 LMR13-51-072	Trace levels of cadmium between the MDL and CRQL were detected in the ICB and CCBs. The original validation did not report or qualify for this calibration blank contamination. The results for four samples have been adjusted to the CRQL and qualified U. The J is added for the serial dilution exceeding criteria.
17014 MERCURY	Mercury	J	U	LMR13-47-024 LMR13-47-048 LMR13-47-096 LMR13-51-048	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCBs. The original validation did not report or qualify for this calibration blank contamination. The results for four samples have been adjusted to the CRQL and qualified U.
17014 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-91-072 LMR13-91-096 LMR13-47-024 LMR13-47-048 LMR13-47-072 LMR13-47-096 LMR13-63-012 LMR13-63-024 LMR13-63-048 LMR13-63-072 LMR13-63-096 LMR13-51-012 LMR13-51-024 LMR13-51-048 LMR13-63-024FD LMR13-51-012FD	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17014 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-47-120 LMR13-63-024 LMR13-63-048	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17014 PAH	Hexachlorobutadiene	U	UJ	LMR13-91-072 LMR13-63-096	The original validators did not report or qualify the associated samples for the hexachlorobutadiene closing CCV %D failure.
17014 PAH	Pyrene	None	J	LMR13-91-072	The original validators did not report or qualify the associated sample results for the Pyrene-d10 low DMC percent recovery.
17014 OIL AND GREASE	HEM	None	J	LMR13-91-072 LMR13-91-096 LMR13-47-024 LMR13-47-048 LMR13-47-072 LMR13-47-096	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were qualified J.
17024 MERCURY	Mercury	None	J	LMR13-45-024FD	The original validator did not qualify mercury for a field duplicate RPD > 100%. A J qualifier was assigned.
17024 AROCLOR	Aroclor-1248	None	J	LMR13-45-048 LMR13-45-072	The original validator did not qualify for four CCV failures. Several results are already qualified J for other reasons. The QATS validator added a J qualifier to two samples.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17024 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-45-012 LMR13-45-024RE LMR13-45-048 LMR13-49-048 LMR13-83-024 LMR13-50-024FD LMR13-83-024FD	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17024 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-50-096 LMR13-50-120	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17024 PAH	1,2,4,5-Tetrachlorobenzene	UJ	U	LMR13-45-048 LMR13-45-072RE LMR13-45-120	Internal standard Phenanthrene-d10 exceeded criteria and associated compounds were qualified. 1,2,4,5-tetrachlorobenzene was incorrectly included in the qualified compounds. The J was removed from the UJ qualifier by the QATS validator.
17024 PAH	2,4-Dinitrophenol	UJ	U	LMR13-49-024 LMR13-49-048 LMR13-49-072 LMR13-50-120 LMR13-49-096 LMR13-49-120 LMR13-83-012 LMR13-83-024	The original validators qualified 2,4-Dinitrophenol UJ due to a closing CCV failure. The laboratory analyzed two closing CCVs. 2,4- dinitrophenol was within criteria in the first CCV and out in the second CCV (50.2 %D). The J was removed from the UJ qualifier by the QATS validators due to the passing %D in the first CCV.
17028 METALS	Chromium Zinc	J	None	LMR13-83-048 LMR13-83-072 LMR13-41-012 LMR13-41-024 LMR13-41-024FD LMR13-41-048 LMR13-57-012 LMR13-26-012 LMR13-26-012FD LMR13-57-024 LMR13-57-048 LMR13-72-048 LMR13-27-012 LMR13-27-024 LMR13-27-024FD LMR13-27-048 LMR13-27-072 LMR13-72-012 LMR13-72-024 LMR13-72-024FD LMR13-72-096 LMR13-27-096 LMR13-72-072	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17028 MERCURY	Mercury	U	J	LMR13-26-012FD LMR13-57-048 LMR13-27-012 LMR13-27-072 LMR13-72-012	Trace levels of mercury were detected in one method blank. The original validators incorrectly qualified five samples that were in the batch associated with the clean blank. The U qualifiers were removed from the five samples and the results returned to the original value with the original J qualifier. Note that the original results for LMR13- 27-072 and LMR13-72-012 were detects. A J qualifier was applied to those samples for failed matrix spike percent recovery.
17028 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-83-048 LMR13-41-012 LMR13-41-048 LMR13-26-012 LMR13-26-012FD LMR13-27-048 LMR13-27-072 LMR13-72-012 LMR13-27-096 LMR13-72-072	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17028 PAH	2-Methylphenol 4-Methlyphenol 2,4-Dimethylphenol	R	UJ	LMR13-83-048 LMR13-27-096	The R qualifier that was applied for the DMC recovery of 2% for 4- Methlyphenol-d8 was replaced with a UJ because the lower acceptance criterion is 8%. Note for LMR13-27-096 the original validators qualified the compounds R on the report forms; however, the qualifiers were not applied in the EDD file. The UJ qualifier was added by the QATS validator.
17028 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-26-012 LMR13-27-012 LMR13-72-012	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17028 PAH	Bis(2-ethylhexyl)phthalate	J	U	LMR13-41-012 LMR13-26-012FD LMR13-57-048 LMR13-27-048 LMR13-27-072	Bis(2-ethylhexyl) phthalate was detected in all three method blanks; however, five samples were not qualified U. For these samples the value was changed to the CRQL and qualified U. Note the laboratory did not apply the B to the Lab qualifiers.
17028 PAH	Di-n-butylphthalate Butylbenzylphthalate	J	U	LMR13-26-012FD LMR13-57-048 LMR13-27-012 LMR13-27-048 LMR13-27-072	Di-n-butylphthalate and butylbenzylphthalate were detected in the associated blank; however, five samples were not qualified U. For these samples the value was changed to the CRQL and qualified U. Note the laboratory did not apply the B to in the lab qualifier column for these samples.
17052 METALS	Cadmium	J	U	LMR13-29-096	Trace levels of cadmium between the MDL and CRQL were detected in the CCBs. The original validation did not report or qualify for this calibration blank contamination. The result for one sample was adjusted to the CRQL and qualified U.
17052 MERCURY	Mercury	J	U	LMR13-28-048	Trace level of mercury between the MDL and CRQL was detected in the CCB. The original validation did not report or qualify for this calibration blank contamination. The result for one sample was changed to the CRQL and qualified U.
17052 AROCLOR	Aroclor-1242	None	J	LMR13-29-048	The original validator did not qualify for a CCV %D failure. One result was already qualified J for another reason. The QATS validator added a J qualifier to one other sample.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17052 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-28-012 LMR13-28-024 LMR13-28-048 LMR13-28-120 LMR13-29-012 LMR13-29-024 LMR13-34-012 LMR13-34-024 LMR13-34-048 LMR13-34-072 LMR13-34-096 LMR13-28-024FD LMR13-34-024FD	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17052 PAH	Pentachlorophenol	UJ	U	LMR13-28-012 LMR13-28-048 LMR13-28-024 LMR13-28-072 LMR13-28-096 LMR13-28-120 LMR13-29-012 LMR13-29-024 LMR13-29-048 LMR13-29-072 LMR13-29-096 LMR13-34-012	The original validators qualified pentachlorophenol UJ due to a closing CCV %D failure. The laboratory analyzed two closing CCVs. Pentachlorophenol was within criteria in the first CCV and out in the second CCV (50.2 %D). The J was removed from the UJ qualifier by the QATS validators due to the passing %D in the first CCV.
17054 AROCLOR	Aroclor-1016 Aroclor-1260	U	UJ	LMR13-32-012 LMR13-32-024 LMR13-32-048 LMR13-32-072 LMR13-75-024	The original validator did not report or qualify for CCV %D failures. The QATS validator added a J qualifier to the existing U for two compounds in five associated samples.
17054 AROCLOR	Aroclor-1016	U	UJ	LMR13-31-012 LMR13-31-024 LMR13-31-024FD LMR13-74-024	The original validator did not report or qualify for CCV %D failures. The QATS validator added a J qualifier to the existing U for one compound in four associated samples.
17054 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-31-024 LMR13-74-024 LMR13-74-012 LMR13-74-072 LMR13-76-012 LMR13-35-012 LMR13-75-024FD	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17054 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-34-168 LMR13-31-012 LMR13-74-024 LMR13-76-012 LMR13-76-024 LMR13-35-012	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17054 PAH	Nitrobenzene	U	UJ	LMR13-32-012 LMR13-32-024 LMR13-32-048 LMR13-32-072 LMR13-75-024 LMR13-31-012 LMR13-31-024 LMR13-74-024 LMR13-75-012 LMR13-74-012 LMR13-74-048 LMR13-74-072 LMR13-76-012	The original validator did not qualify nitrobenzene for opening CCV %D failure. The QATS validator added a J qualifier to the existing U in the associated samples.
17054 PAH	2,4-Dinitrophenol	UJ	U	LMR13-32-012 LMR13-32-024 LMR13-32-048 LMR13-32-072 LMR13-75-024 LMR13-31-012 LMR13-31-024 LMR13-74-024 LMR13-75-012 LMR13-74-012 LMR13-74-048 LMR13-74-072 LMR13-76-012	The original validators qualified 2,4-Dinitrophenol UJ due to a closing CCV failure. The laboratory analyzed two closing CCVs. 2,4- dinitrophenol was within criteria in the second CCV and out in the first CCV. The J was removed from the UJ qualifier by the QATS validators due to the passing %D in the second CCV.
17054 PAH	3,3'-Dichlorobenzidine	U	UJ	LMR13-76-024 LMR13-35-024	The original validator did not report or qualify 3,3'-Dichlorobenzidine for opening CCV %D failure. The QATS validator added a J qualifier to the existing U in the associated samples.
17055 METALS	Lead	J	None	LMR13-48-072 LMR13-48-096 LMR13-48-120 LMR13-48-144 LMR13-48-168 LMR13-82-012 LMR13-82-024 LMR13-82-024FD LMR13-82-072 LMR13-03-012 LMR13-03-024 LMR13-03-048 LMR13-03-072 LMR13-03-096 LMR13-03-120 LMR13-82-048 LMR13-82-096 LMR13-82-120 LMR13-82-144	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17055 MERCURY	Mercury	J	U	LMR13-03-120	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCBs. The original validation did not report or qualify for this calibration blank contamination. The result for one sample has been adjusted to the CRQL and qualified U.
17055 AROCLOR	Aroclor-1016 Aroclor-1260	U	UJ	LMR13-48-072 LMR13-48-096 LMR13-48-120 LMR13-48-144 LMR13-48-168	The original validator did not report or qualify for CCV %D failures. The QATS validator added a J qualifier to the existing U for two compounds in five associated samples.
17055 AROCLOR	Aroclor-1242	U	UJ	LMR13-82-012 LMR13-82-024 LMR13-82-024FD LMR13-82-072 LMR13-03-024 LMR13-03-048 LMR13-03-072 LMR13-03-096 LMR13-03-120 LMR13-82-048 LMR13-82-096 LMR13-82-120 LMR13-82-144	The original validator did not report or qualify for CCV %D failures. The QATS validator added a J qualifier to the existing U.
17055 AROCLOR	Aroclor-1248	None	J	LMR13-82-012 LMR13-82-024 LMR13-82-024FD	The original validator did not report or qualify for CCV %D failures. The QATS validator added a J qualifier.
17055 AROCLOR	Aroclor-1248	U	UJ	LMR13-82-072 LMR13-03-012 LMR13-03-024 LMR13-03-048 LMR13-03-072 LMR13-03-096 LMR13-03-120 LMR13-82-048 LMR13-82-096 LMR13-82-120 LMR13-82-144	The original validator did not report or qualify for CCV %D failures. The QATS validator added a J qualifier to the existing U.
17055 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-48-072 LMR13-48-120 LMR13-48-144 LMR13-82-012 LMR13-82-024 LMR13-03-024FD LMR13-82-096 LMR13-82-120 LMR13-82-144	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17055 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-03-012	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision

17056 PAH SIM	Naphthalene Acenaphthylene Phenanthrene Benzo(a)pyrene C1-Naphthalenes	U	UJ	LMR13-78-012	The sample was analyzed 48 days after extraction, which exceeds the analysis holding time by 8 days. Non-detected compounds were qualified UJ.
17056 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-35-048 LMR13-77-012 LMR13-38-024 LMR13-38-024FD LMR13-77-024FD LMR13-40-012 LMR13-40-024FD	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17056 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-76-048 LMR13-76-072	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17061 AROCLOR	Aroclor-1016 Aroclor-1260	U	UJ	LMR13-79-072 LMR13-79-096 LMR13-38-012 LMR13-40-072 LMR13-40-096 LMR13-79-012 LMR13-79-024 LMR13-01-072 LMR13-38-048 LMR13-38-096 LMR13-40-048	The original validators did not report or qualify the associated samples for the Aroclor-1016 and Aroclor-1260 CCV %D failure.
17061 PAH SIM	Naphthalene 2-Methylnaphthalene Acenaphthylene Benzo(e)pyrene Perylene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(g,h,i)perylene	None	J	LMR13-01-012	The sample was analyzed 42 days after extraction, which exceeds the 40-day analytical holding time. The original validators did not qualify for the holding time exceedance. Compounds not already qualified J were qualified J.
17061 PAH	Benzo(b)fluoranthene Dibenzo(a,h)anthracene	U	UJ	LMR13-79-072 LMR13-79-096 LMR13-79-024 LMR13-38-096 LMR13-01-120	The original validators did not qualify the associated samples for the initial calibration %RSD failure.
17061 PAH	Dibenzo(a,h)anthracene	U	UJ	LMR13-01-096	The original validators did not qualify the associated samples for the initial calibration %RSD failure.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17061 PAH	Benzo(b)fluoranthene	None	J	LMR13-38-012 LMR13-40-072 LMR13-40-096 LMR13-79-012 LMR13-38-048 LMR13-01-012 LMR13-01-024 LMR13-01-048 LMR13-48-024 LMR13-48-012 LMR13-48-048 LMR13-48-024FD	The original validators did not qualify the associated samples for the initial calibration %RSD failure.
17061 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-38-012 LMR13-01-072 LMR13-40-048	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC. (Unless the compound was a detected result qualified J).
17061 PAH	Di-n-octylphthalate	UJ	U	LMR13-38-048 LMR13-38-096 LMR13-40-048 LMR13-01-096 LMR13-01-120	The original validators qualified di-n-octylphthalate UJ due to a closing CCV %D failure. The laboratory analyzed two closing CCVs. Di-n- octylphthalate was within criteria in the second CCV and out in the first CCV (50.2 %D). The J was removed from the UJ qualifier by the QATS validators due to the passing %D in the second CCV.
17061 OIL AND GREASE	HEM	None or U	J or UJ	LMR13-79-072 LMR13-79-096 LMR13-38-012 LMR13-40-072 LMR13-40-096 LMR13-79-012 LMR13-79-024 LMR13-38-048 LMR13-38-096 LMR13-40-048	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were qualified J or UJ. Note that some of these samples were incorrectly qualified for MS/MSD recoveries in the EDD file. The qualifiers were highlighted blue to indicate the different reason for the qualification.
17061 OIL AND GREASE	HEM	J or UJ	None or U	LMR13-01-012 LMR13-01-024 LMR13-01-048 LMR13-01-096 LMR13-48-048 LMR13-48-024FD LMR13-79-024FD	The samples were incorrectly qualified for MS/MSD recoveries. The MS/MSD recoveries were within criteria for the QC sample associated with these samples.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17071 PAH	All Compounds	U, J, or None	ZZZ	LMR13-13-024	The sample was reanalyzed due to low internal standard recoveries. The re-analysis produced better results; however, the reanalysis was not included in the EDD file. Upon request, the reanalysis EDD was sent to the QATS validators and incorporated into the Region 5 EDD. The original analysis was set to NO in the reportable result column and ZZZ were entered into the validator qualifier column. The reanalysis was set to YES in the reportable result column and validation qualifiers were added as needed.
17071 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-08-048 LMR13-13-012 LMR13-13-024RE LMR13-14-120 LMR13-13-120 LMR13-14-096 LMR13-08-024 LMR13-25-072 LMR13-08-024FD LMR13-08-012 LMR13-14-012	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17071 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-13-012 LMR13-08-024	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17071 SEM MERCURY	SEM Mercury	J	U	LMR13-25-012FD LMR13-82-024 LMR13-82-024FD	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied. The QATS validator added a J qualifier.
17055 AROCLOR	Aroclor-1248	U	UJ	LMR13-82-072 LMR13-03-012 LMR13-03-024 LMR13-03-048 LMR13-03-072 LMR13-03-096 LMR13-03-120 LMR13-82-048 LMR13-82-096 LMR13-82-120 LMR13-82-144	The original validator did not report or qualify for CCV %D failures. The QATS validator added a J qualifier to the existing U.
17055 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-48-072 LMR13-48-120 LMR13-48-144 LMR13-82-012 LMR13-82-024 LMR13-03-024FD LMR13-82-096 LMR13-82-120 LMR13-82-144	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17055 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-03-012	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17055 PAH SIM	Naphthalene 1-Methylnaphthalene 2-Methylnaphthalene Acenaphthylene Acenaphthene Fluorene Anthracene Perylene Dibenzo(a,h)anthracene	None	J	LMR13-82-012 LMR13-03-012	The sample was analyzed 43 days after extraction, which exceeds the analysis holding time by 3 days. Detected compounds (not already qualified J) reported from this sample were qualified J.
17055 OIL AND GREASE	HEM	None	J	LMR13-03-048	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were qualified J.
17055 OIL AND GREASE	HEM	U	UJ	LMR13-03-072 LMR13-03-096 LMR13-03-120	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were qualified UJ.
17056 METALS	Zinc	J	None	LMR13-35-024FD LMR13-35-048 LMR13-76-024FD LMR13-76-048 LMR13-76-072 LMR13-35-072 LMR13-35-096 LMR13-77-012 LMR13-77-024 LMR13-77-048 LMR13-77-072 LMR13-38-024 LMR13-38-072 LMR13-78-012 LMR13-78-024 LMR13-78-024FD LMR13-40-012 LMR13-40-024 LMR13-79-048 LMR13-79-048FD	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
17056 MERCURY	Mercury	U	None	LMR13-35-024FD LMR13-35-048 LMR13-38-024	Trace level of mercury between the MDL and CRQL was detected in the MB. The original validation qualified results greater than the CRQL and greater than 5x the blank level as U. The U qualifier was removed.
17056 AROCLOR	Aroclor-1254	None	J	LMR13-35-024FD	The original validator did not qualify for CCV %D failures. A J qualifier was added.
17056 PAH SIM	Fluoranthene Pyrene Chrysene Benzo(g,h,i)perylene	None	J	LMR13-78-012	The sample was analyzed 48 days after extraction, which exceeds the analysis holding time by 8 days. Detected compounds (not already qualified J) reported from this sample were qualified J.
17056 PAH SIM	Naphthalene Acenaphthylene Phenanthrene Benzo(a)pyrene C1-Naphthalenes	U	UJ	LMR13-78-012	The sample was analyzed 48 days after extraction, which exceeds the analysis holding time by 8 days. Non-detected compounds were qualified UJ.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17056 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-35-048 LMR13-77-012 LMR13-38-024 LMR13-38-024FD LMR13-77-024FD LMR13-40-012 LMR13-40-024FD	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17056 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-76-048 LMR13-76-072	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.

The samples were qualified J or UJ.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17078 METALS	Chromium Copper Zinc	J	None	LMR13-25-096 LMR13-13-048 LMR13-14-024 LMR13-71-012 LMR13-71-024 LMR13-71-048 LMR13-71-072 LMR13-07-024FD LMR13-71-024FD LMR13-07-012 LMR13-07-024 LMR13-07-048 LMR13-07-072 LMR13-21-048 LMR13-15-024FD LMR13-15-024 LMR13-21-012 LMR13-21-024 LMR13-21-072 LMR13-15-012	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
17078 AROCLOR	Aroclor-1016 Aroclor-1221 Aroclor-1232 Aroclor-1242 Aroclor-1262 Aroclor-1268	UJ	U	LMR13-13-048	Sample LMR13-13-048 was qualified UJ and J in the EDD file. The original validated Form I did not reflect qualifiers other than the U and J for the concentration qualifiers. The data validation report did not explain why qualifiers were entered for this sample. The QATS validators removed the J and left the original U.
17078 AROCLOR	Aroclor-1248 Aroclor-1254	J	None	LMR13-13-048	Sample LMR13-13-048 was qualified UJ and J in the EDD file. The original validated Form I did not reflect qualifiers other than the U and J for the concentration qualifiers. The data validation report did not explain why qualifiers were entered for this sample. The QATS validators removed the J qualifier.
17078 PAH SIM	Benzo(e)pyrene Pyrene	None	J	LMR13-21-012 LMR13-15-012 LMR13-21-012FD	The original validator did not qualify benzo(e)pyrene or pyrene for opening CCV %D failure. J qualifiers were added to the associated samples.
17078 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-71-024 LMR13-71-024FD LMR13-15-012	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC. (Unless the compound was a detected result qualified J).
17078 SEM MERCURY	SEM Mercury	J	U	LMR13-15-012	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17083 METALS	Copper	J	None	LMR13-87-012 LMR13-87-024 LMR13-87-072 LMR13-87-096 LMR13-86-024FD LMR13-86-012 LMR13-86-024 LMR13-87-048 LMR13-87-120 LMR13-84-024FD LMR13-84-012 LMR13-84-024 LMR13-84-048 LMR13-84-072 LMR13-86-048 LMR13-86-096 LMR13-30-012 LMR13-30-024 LMR13-30-048	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
17083 PAH	4-Chloroaniline 3,3'-Dichlorobenzidine	R	U	LMR13-87-012 LMR13-87-048	The R qualifier that was applied for the DMC recovery of 0% for 4- Chloroaniline-d4 was removed because the sample was run at a dilution and the DMC was diluted out. The QATS validator removed the R qualifier and changed it back to the original U.
17083 PAH	Hexachlorocyclopentadiene	R	UJ	LMR13-87-012 LMR13-87-048	The R qualifier that was applied for the DMC recovery of 0% for 4- Chloroaniline-d4 was removed because the sample was run at a dilution and the DMC was diluted out. The R qualifier was removed and replaced with a UJ because the %D for hexachlorocyclopentadiene failed criteria in the closing CCVs.
17083 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	U	LMR13-87-072	The R qualifier that was applied for the DMC recovery of 0% for 4- Chloroaniline-d4 was removed because the sample was run at a dilution and the DMC was diluted out. The QATS validator removed the R qualifier and changed it back to the original U.
17083 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-84-012 LMR13-84-024 LMR13-84-048 LMR13-84-072	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17083 PAH	Phenanthrene Anthracene	J	None	LMR13-87-048	The J qualifier that was applied for the DMC recovery for anthracene- d10 was removed because the sample was run at a dilution.
17083 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-87-012 LMR13-86-012	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17083 PAH	4-Nitroaniline	UJ	U	LMR13-84-012 LMR13-84-024 LMR13-84-048 LMR13-84-072 LMR13-86-048 LMR13-86-096 LMR13-30-024 LMR13-30-048 LMR13-30-024FD	The original validators qualified 4-Nitroaniline UJ due to a closing CCV %D failure. The laboratory analyzed two closing CCVs. 4-nitroaniline was within criteria in the first CCV and out in the second CCV (53.2 %D). The J was removed from the UJ qualifier due to the passing %D in the first CCV.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17083 PAH	Indeno(1,2,3-cd)pyrene Benzo(g,h,i)perylene	J	None	LMR13-86-048 LMR13-86-096 LMR13-30-024 LMR13-30-048 LMR13-30-024FD	The original validators qualified these compounds J based on a calibration that was not analyzed within the 12-hour window. The alternate continuing calibration standard was analyzed within the 12- hour window and was within criteria for these compounds. The QATS validators removed the J qualifiers.
17083 PAH	2,4-Dinitrophenol	UJ	U	LMR13-87-024 LMR13-87-096 LMR13-87-120	The original validators qualified 2,4-Dinitrophenol UJ due to a closing CCV %D failure. The laboratory analyzed two closing CCVs. 2,4- dinitrophenol was within criteria in the first CCV and out in the second CCV (50.5 %D). The J was removed from the UJ qualifier due to the passing %D in the first CCV.
17083 PAH	Fluoranthene Benzo(a)anthracene Chrysene	J	None	LMR13-86-096	The J qualifier that was applied for the DMC recovery for pyrene-d10 was removed because the sample was run at a dilution. Note that the pyrene result is qualified J due to an ICAL %RSD failure.
17083 SEM MERCURY	SEM Mercury	J	U	LMR13-86-012	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.
17083 OIL AND GREASE	HEM	None or U	J or UJ	LMR13-84-012 LMR13-87-024FD LMR13-87-120 LMR13-87-048 LMR13-86-012 LMR13-87-096 LMR13-87-072 LMR13-87-024 LMR13-87-012 LMR13-84-024 LMR13-84-048 LMR13-84-072 LMR13-86-048 LMR13-86-096 LMR13-30-024 LMR13-30-048 LMR13-30-024FD	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were qualified J or UJ.
17096 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-39-048 LMR13-85-024 LMR13-67-012 LMR13-67-024 LMR13-67-048 LMR13-85-012 LMR13-89-024FD LMR13-85-024FD	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC. (Unless the compound was a detected result qualified J).
17096 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-85-024 LMR13-85-048 LMR13-85-024FD	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17096 PAH SIM	Benzo(e)pyrene	None	J	LMR13-88-012	The original validator did not report or qualify Benzo(e)pyrene for opening CCV %D failure. A J qualifier was assigned to the associated sample.
17096 SEM MERCURY	SEM Mercury	J	U	LMR13-39-012	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.
17096 OIL AND GREASE	HEM	None or U	J or UJ	LMR13-55-048 LMR13-55-072 LMR13-89-012 LMR13-89-024 LMR13-39-048 LMR13-88-012 LMR13-88-024 LMR13-88-048 LMR13-39-012 LMR13-39-024 LMR13-39-072 LMR13-85-024 LMR13-85-048 LMR13-67-012 LMR13-67-024 LMR13-67-048 LMR13-85-012 LMR13-89-024FD LMR13-85-024FD	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were qualified J or UJ.
17099 METALS	Chromium	J	None	LMR13-86-072 LMR13-33-072 LMR13-33-096 LMR13-54-012 LMR13-54-024 LMR13-54-048 LMR13-33-024FD LMR13-33-024 LMR13-33-048 LMR13-54-072 LMR13-54-096 LMR13-54-120 LMR13-30-096 LMR13-30-120 LMR13-33-012 LMR13-55-012 LMR13-54-048FD LMR13-55-024FD LMR13-55-024 LMR13-30-072	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17099 PAH	Phenanthrene Anthracene	J	None	LMR13-33-096	Phenanthrene and Anthracene were incorrectly qualified J by the original validators. These compounds are not associated with internal standards or DMC %R that failed criteria. There is no explanation for the qualifiers in the DVR, therefore the QATS validator removed the J qualifiers.
17099 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-86-072	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17099 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-54-120	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC. (Unless the compound was a detected result qualified J).
17099 PAH SIM	Naphthalene 1-Methlynaphthalene 2-Methylnaphthalene Acenaphthene Fluorene Anthracene Benzo(e)pyrene Perylene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(g,h,i)perylene	None	J	LMR13-54-012 LMR13-33-012 LMR13-55-012	These samples were analyzed 47 or 48 days after extraction, which exceeds the analysis holding time by 7 or 8 days. Detected compounds (not already qualified J) reported from these samples were qualified J.
17099 SEM MERCURY	SEM Mercury	J	U	LMR13-55-012	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.
17099 OIL AND GREASE	HEM	J	J	LMR13-86-072 LMR13-33-072 LMR13-33-096 LMR13-54-012 LMR13-54-024 LMR13-54-048 LMR13-33-024FD LMR13-33-024 LMR13-33-048 LMR13-54-072 LMR13-54-096 LMR13-54-120 LMR13-30-096 LMR13-30-120 LMR13-33-012 LMR13-55-012 LMR13-33-048FD LMR13-54-024FD LMR13-55-024 LMR13-30-072	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were already qualified J for failed MSD % recovery and %RPD in the EDD file. The qualifiers were highlighted blue to indicate another reason for the qualification.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17122 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-64-012 LMR13-64-048 LMR13-64-048FD LMR13-67-072 LMR13-67-096 LMR13-64-024 LMR13-64-072 LMR13-64-096 LMR13-69-012 LMR13-69-048 LMR13-92-012 LMR13-92-024 LMR13-65-012 LMR13-65-024	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC. (Unless the compound was a detected result qualified J).
17122 PAH	Hexachlorocyclopentadiene	U	UJ	LMR13-92-024	Hexachlorocyclopendadiene was not qualified UJ by the original validators. The UJ was added due to %D failures in both closing CCVs.
17122 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-64-096 LMR13-68-012 LMR13-69-024	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17122 PAH	Bis(2-ethylhexyl)phthalate	None	UJ	LMR13-64-048FD LMR13-67-096 LMR13-67-120 LMR13-64-120 LMR13-69-072	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank. The J qualifier was added to the U because of exceeded holding time.
17122 PAH	Di-n-octylphthalate	UJ	U	LMR13-64-024 LMR13-64-072 LMR13-64-096 LMR13-92-024 LMR13-65-024 LMR13-69-024	The original validators qualified di-n-octylphthalate UJ due to a closing CCV %D failure. The laboratory analyzed two closing CCVs. Di-n- octylphthalate was within criteria in the first CCV and out in the second CCV. The J was removed from the UJ qualifier by the QATS validators due to the passing %D in the first CCV.
17122 PAH	Caprolactam	UJ	U	LMR13-68-012	The original validators qualified caprolactam UJ due to a CCV %D failure. The %D was not out of criteria for caprolactam in the associated CCV, but was out of criteria for a different analysis date. The J was removed from the UJ qualifier due to the passing %D in the associated CCV.
17122 SEM MERCURY	SEM Mercury	J	U	LMR13-65-012	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17122 OIL AND GREASE	HEM	J	J	LMR13-64-024 LMR13-64-072 LMR13-64-096 LMR13-64-120 LMR13-69-012 LMR13-68-012 LMR13-69-048 LMR13-69-072 LMR13-92-012 LMR13-92-024 LMR13-65-012 LMR13-65-024 LMR13-69-024 LMR13-64-012 LMR13-64-048 LMR13-64-048FD LMR13-67-072 LMR13-67-096 LMR13-67-120	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were already qualified J for failed MS/MSD recoveries in the EDD file. The qualifiers were highlighted blue to indicate another reason for the qualification.
17125 METALS	Copper	J	None	LMR13-69-024FD LMR13-69-096 LMR13-69-120 LMR13-61-012 LMR13-61-048 LMR13-61-096 LMR13-65-048 LMR13-65-072 LMR13-61-024 LMR13-61-072 LMR13-61-120 LMR13-66-012 LMR13-66-024 LMR13-60-012 LMR13-60-024 LMR13-60-048 LMR13-60-072 LMR13-60-096 LMR13-66-048 LMR13-58-024	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
17125 PAH	Bis(2-ethylhexyl)phthalate	None	UJ	LMR13-69-096 LMR13-69-120 LMR13-61-048 LMR13-61-096 LMR13-65-072 LMR13-61-072 LMR13-58-024	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank. The J qualifier was added to the U because of exceeded holding time.
17125 PAH	Pyrene Bis(2-ethylhexyl)phthalate	None	J	LMR13-61-024	Internal standard area recoveries for Chrysene-d12 and Perylene-d12 were out of criteria. Associated detected results (not already qualified J) are qualified J.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17125 PAH	Butylbenzylphthalate 3,3'-Dichlobenzidine Di-n-octlyphthalate Dibenzo(a,h)anthracene	U	UJ	LMR13-61-024	Internal standard area recoveries for Chrysene-d12 and Perylene-d12 were out of criteria. Associated non-detected results are qualified UJ.
17125 PAH SIM	C1-Fluoranthenes/Pyrenes C1-Chrysenes	U	J	LMR13-66-012	The original validators incorrectly qualified the sample for blank contamination. The results were qualified JB by the laboratory, B for the blank contamination and J because modification 1734.2 requires a J qualifier be added to the PAH Alkyl Homologues since no separate calibration is required for PAH alkyl homologues. The original validators incorrectly qualified these compounds U based on the J qualifier, when the actual concentration was above 10 X the CRQL. The QATS validators removed the U and replaced the qualifier with the original J.
17125 SEM MERCURY	SEM Mercury	J	U	LMR13-66-012	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.
17125 OIL AND GREASE	HEM	J or UJ	J or UJ	LMR13-69-096 LMR13-69-120 LMR13-61-012 LMR13-61-048 LMR13-61-096 LMR13-65-048 LMR13-65-072 LMR13-61-024 LMR13-61-072 LMR13-61-120 LMR13-66-012 LMR13-66-024 LMR13-60-012 LMR13-60-024 LMR13-60-048 LMR13-60-072 LMR13-60-096 LMR13-66-048 LMR13-58-024 LMR13-66-024FD	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were already qualified J for MSD recovery in the EDD file. The qualifiers were highlighted blue to indicate another reason for the qualification.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17127 METALS	Lead	J	None	LMR13-59-012 LMR13-59-024 LMR13-59-048 LMR13-94-024 LMR13-94-072 LMR13-58-012 LMR13-94-012 LMR13-94-048 LMR13-95-012 LMR13-70-024 LMR13-95-024 LMR13-95-048 LMR13-95-072 LMR13-95-096	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
17127 MERCURY	Mercury	J	U	LMR13-59-024 LMR13-59-048 LMR13-58-012 LMR13-70-024	Trace level of mercury between the MDL and CRQL was detected in the ICB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied to the four affected samples.
17127 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-59-012 LMR13-58-012 LMR13-70-024	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17127 PAH	Bis(2-ethylhexyl)phthalate	None	UJ	LMR13-58-012	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank. The J qualifier was added to the U because of exceeded holding time.
17127 PAH	Phenanthrene Anthracene Fluoranthene	J	None	LMR13-94-024	These compounds were qualified J by the original validators. There is no explanation for the qualifiers in the DVR, therefore the QATS validator removed the J qualifiers.
	Pyrene Benzo(a)anthracene Chrysene				
17127 PAH	Naphthalene 2-Methylnaphthalene Fluorene Phenanthrene Anthracene Fluoranthene Pyrene	None	J	LMR13-95-024FD	This sample was analyzed 46 days after extraction, which exceeds the analysis holding time by 6 days. Detected compounds (not already qualified J) reported from these samples were qualified J.
17127 PAH	46 Compounds	U	UJ	LMR13-95-024FD	This sample was analyzed 46 days after extraction, which exceeds the analysis holding time by 6 days. Non-detected compounds reported from these samples were qualified UJ.
17127 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-70-024	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.

Table 3-2 QATS Revised Data Qualifiers

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17127 PAH SIM	C1-Naphthalenes C2-Naphthalenes C1-Phenanthrenes/Anthracenes C2-Phenanthrenes/Anthracenes C1-Fluoranthenes/Pyrenes C1-Chrysenes	U	J	LMR13-94-012 LMR13-95-012	The original validators incorrectly qualified these samples for blank contamination. The results were qualified JB by the laboratory, B for the blank contamination and J because modification 1734.2 requires a J qualifier be added to the PAH Alkyl Homologues since no separate calibration is required for PAH alkyl homologues. The original validators qualified these compounds U based on the J qualifier, when the actual concentration was above 10 X the CRQL. The QATS validators removed the U and replaced the qualifier with the original J.
17127 PAH SIM	C2-Naphthalenes C1-Phenanthrenes/Anthracenes C2-Phenanthrenes/Anthracenes C1-Fluoranthenes/Pyrenes C1-Chrysenes	U	J	LMR13-58-012	The original validators incorrectly qualified the sample for blank contamination. The results were qualified JB by the laboratory, B for the blank contamination and J because modification 1734.2 requires a J qualifier be added to the PAH Alkyl Homologues since no separate calibration is required for PAH alkyl homologues. The original validators qualified these compounds U based on the J qualifier, when the actual concentration was above 10 X the CRQL. The concentration was incorrectly changed to the lower CRQL. The QATS validators removed the U and replaced the qualifier with the original J and re-entered the original concentration in the result column.
17127 SEM MERCURY	SEM Mercury	J	U	LMR13-95-012	Trace level of mercury between the MDL and CRQL was detected in the ICB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.
17127 OIL AND GREASE	HEM	J or UJ	J or UJ	LMR13-59-012 LMR13-59-024 LMR13-59-048 LMR13-94-024 LMR13-94-072 LMR13-58-012 LMR13-94-012 LMR13-94-048 LMR13-95-012 LMR13-70-024 LMR13-95-024 LMR13-95-048 LMR13-95-072 LMR13-95-096 LMR13-95-024FD	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The sample results were qualified J or UJ.

Table 3-2 QATS Revised Data Qualifiers

A full data validation was performed on the analytical data for twenty-four sediment samples collected on June 11, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOCs	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan

for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in four samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Semivolatile Organic Compounds (SVOCs)

Holding Times

- All samples were extracted within 14 days for soil samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met.

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
07/08/13 (1941)	Hexachlorocyclopentadiene	53.1%	J/UJ	1-4, 12
07/09/13 (1841)	Hexachlorocyclopentadiene	54.8%	J/UJ	20, 22, 23, 24
	2,4-Dinitrophenol	51.9%	J/UJ	
07/13/13 (0014)	Hexachlorocyclopentadiene	61.5%	J/UJ	25

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKL1	Butylbenzylphthalate	25	U	2-5, 12, 13, 15, 17
	bis(2-Ethylhexyl)phthalate	39	U	3, 5, 17
SBLKL4	Butylbenzylphthalate	11	U	20, 22-25
	bis(2-Ethylhexyl)phthalate	22	None	All >10X
	di-n-Octylphthalate	1.7	None	All ND

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values except the following.

Sample ID	Surrogate	%R	Qualifier
5	4-Methylphenol-d8	101%	None - All Associated ND
	4-Chloroaniline-d4	0%	R - Associated Compounds
12	Phenol-d5	105%	J- Associated Compounds
	4-Methylphenol-d8	105%	None - All ND
13	Phenol-d5	113%	J - Associated Compounds
	4-Methylphenol-d8	117%	None - All ND
	4-Chloroaniline-d4	0%	R - Associated Compounds
15	4-Chloroaniline-d4	0%	
17	4-Chloroaniline-d4	0%	
22	4-Methylphenol-d8	108%	None - All ND
24	Phenol-d5	115%	J - Associated Compounds
	4-Methylphenol-d8	117%	None - All ND
25	Phenol-d5	121%	J
	4-Methylphenol-d8	118%	None - ND

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values.

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate samples were not analyzed.

Polychlorinated Biphenyls (PCBs)

Holding Times

- All samples were extracted within 14 days for soil samples and analyzed within 40 days.

Initial Calibration

- All %RSD and/or correlation coefficient criteria were met.

Continuing Calibration

- All %D criteria were met.

Method Blank

- The method blanks were free of contamination.

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate recoveries.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values.

Laboratory Control Samples

- The LCS sample exhibited acceptable %R values.

Compound Quantitation

- EDS Sample ID #1 exhibited aroclor-1248 that exceeded the calibration range. The sample was reanalyzed at a 3X dilution. The reviewer replaced the original results with the dilution results. Use original results for reporting purposes.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

PCBs				
Compound	LMR13-18-012 ug/kg	LMR13-18-012FD ug/kg	RPD	Qualifier
Aroclor-1248	91	110	19%	None
Aroclor-1254	69	87	23%	
Aroclor-1260	15	19	24%	

PCBs				
Compound	LMR13-02-012 ug/kg	LMR13-02-012FD ug/kg	RPD	Qualifier
Aroclor-1242	37	32	14%	None
Aroclor-1254	29	26	11%	
Aroclor-1260	5.8	46U	None	

GC Column Difference Results

- Several samples exhibited high %D values > 25% between columns and have been qualified as estimated (J) by the reviewer.

Metals & Mercury

Holding Times

- All samples were prepared and analyzed within 28 days for mercury and 180 days for all other metals.

ICP/MS Tuning

- Not applicable.

Initial Calibration Verification

- All initial calibration criteria were met.

Continuing Calibration Verification

- All continuing calibration criteria were met.

Method Blank

- The method blanks were free of contamination.

Field Blank

- Field QC samples were not analyzed.

ICP Interference Check Sample

- The ICP interference check sample exhibited acceptable %R values.

Laboratory Control Samples

- The LCS sample exhibited acceptable recoveries.

Matrix Spike/Duplicate (MS/DUP) Analysis

- The MS/DUP samples exhibited acceptable %R and RPD values except the following.

DUP Sample ID	Compound	DUP %R/RPD	Qualifier	Affected samples
4	Mercury	154%	J	All Samples Except 20

ICP Serial Dilution

- ICP serial dilution percent differences (%D) were within acceptance limits except the following.

ICP Sample ID	Compound	%D	Qualifier	Affected Samples
4	Chromium	14%	J	All Samples
	Nickel	16%	J	
	Zinc	15%	J	

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

Metals				
Compound	LMR13-19-012 mg/kg	LMR13-19-012FD mg/kg	RPD	Qualifier
Arsenic	6.7	6.5	3%	None
Cadmium	1.2	0.89	30%	
Chromium	25.2	20.2	22%	
Copper	23.6	23.6	0%	
Lead	38.8	32.2	19%	
Mercury	0.18	0.14	25%	
Nickel	23.8	19.4	20%	
Zinc	113	95.8	16%	

Metals				
Compound	LMR13-02-012 mg/kg	LMR13-02-012FD mg/kg	RPD	Qualifier
Arsenic	4.2	4.2	0%	None
Cadmium	0.43	0.45	5%	
Chromium	11.6	11.8	2%	
Copper	11.7	11.2	4%	
Lead	10.6	11.2	6%	
Mercury	0.14	0.061	79%	
Nickel	14.7	14.9	1%	
Zinc	45.5	47.3	4%	

Oil & Grease, Total Organic Carbon

Holding Times

- All samples were analyzed within the recommended holding time for each analysis.

Initial and Continuing Calibration

- All %R criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
240-89836/1-A	HEM	120.1	U	2, 5, 6, 10, 19

Field Blank

- Field QC samples were not included in this data package.

Laboratory Control Samples

- The LCS samples exhibited acceptable %R values.

Matrix Spike/Duplicate (MS/DUP) Recoveries

- The MS/DUP samples exhibited acceptable %R and RPD values.

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

Wet Chemistry/AVS/SEM				
Compound	LMR13-05-012 mg/kg	LMR13-05-012FD mg/kg	RPD	Qualifier
HEM	2500	2550	2%	None

Wet Chemistry/AVS/SEM				
Compound	LMR13-20-012 mg/kg	LMR13-20-012FD mg/kg	RPD	Qualifier
HEM	625	402U	200%	J/UJ

Please contact the undersigned at (757) 564-0090 if you have any questions or need further information.

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-six sediment samples collected on June 12, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOC	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in two samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Semivolatile Organic Compounds (SVOC)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met.

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
07/11/13	Pentachlorophenol	37.9%	J/UJ	1-5, 7, 8, 12
07/14/13	Hexachlorocyclopentadiene	61.5%	J/UJ	20, 22

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKL4	Butylbenzylphthalate	11	U	5, 6, 7
	bis(2-Ethylhexyl)phthalate	22	U	4, 5, 6, 7
	di-n-Octylphthalate	1.7	U	1, 8, 9
SBLKL8	Butylbenzylphthalate	29	U	23, 24, 25

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKL8	bis(2-Ethylhexyl)phthalate	83	U	23, 24, 25

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values except the following.

Sample ID	Surrogate	%R	Qualifier
23	4-Chloroaniline-d4	0%	R - Associated Compounds
25	Phenol-d5	106%	J - Positive Results
	4-Methylphenol-d8	105%	None - ND
	4-Chloroaniline-d4	0%	R - Associated Compounds
Several	Several	"0D"	Dilution - Results Not Valid

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values except the following.

MS/MSD Sample ID	Compound	MS %R/MSD %R/ RPD	Qualifier
1	4-Nitrophenol	0%/0%/--	None - Sample Analyzed at 14.3X Dilution
	Pentachlorophenol	0%/0%/--	
	Pyrene	31%/OK/OK	

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- Several samples were analyzed at various dilutions due to high concentrations of target compounds. No action was required.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

SVOC				
Compound	LMR13-42-024 ug/kg	LMR13-42-024FD ug/kg	RPD	Qualifier
Acetophenone	59	580U	NC	None
Naphthalene	110	150	31%	
2-Methylnaphthalene	610U	72	NC	
Acenaphthylene	150	190	24%	
Acenaphthene	190	190	0%

Benzo(g,h,i)perylene	180	180	0%	

Polynuclear Aromatic Hydrocarbons (PAH 34)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met.

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
07/30/13	Dibenzo(a,h)anthracene	31.2%	J/UJ	1DL, 22

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLK4L	Naphthalene	0.24	None	All >5X
	Fluoranthene	0.21	None	
	Pyrene	0.15	None	
	Benzo(a)anthracene	0.091	None	
	Chrysene	0.14	None	
	Benzo(b)fluoranthene	0.16	None	
	Benzo(k)fluoranthene	0.13	None	
	Total 16 PPAH	1.1	None	
	Total PAH	1.1	None	
SBLKL4	Naphthalene	0.24	None	
	Total 16 PPAH	0.24	None	
	Total PAH	0.24	None	
SBLKL8	Naphthalene	0.18	None	
	Phenanthrene	0.17	None	
	Total 16 PPAH	0.35	None	
	Total PAH	0.35	None	

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values except the following.

Sample ID	Surrogate	%R	Qualifier
1DL	Fluroranthene-d10	158%	None for 1 Out per Fraction

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values except the following.

MS/MSD Sample ID	Compound	MS %R/MSD %R/ RPD	Qualifier
1	Several Out	Results Not Valid	None - Sample Analyzed at 6.7X Dilution

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- EDS Sample ID #1 exhibited high concentrations of several target compounds and were flagged (E) by the laboratory. The sample was reanalyzed at a 50X dilution and the dilution results should be used for these compounds. Several of the compounds remained flagged (E) in the dilution analysis and these results were qualified estimated (J).
- EDS Sample ID #22 exhibited high concentrations of several target compounds and were flagged (E) by the laboratory. However, a dilution analysis was not performed and these compounds were qualified estimated (J).
- Total 16 PPAH and Total PAH were estimated (J) in all samples due to blank contamination.

Field Duplicate Sample Precision

- Field duplicate samples were not analyzed.

Polychlorinated Biphenyls (PCBs)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days.

Initial Calibration

- All %RSD and/or correlation coefficient criteria were met.

Continuing Calibration

- All %D criteria were met.

Method Blank

- The method blanks were free of contamination.

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate recoveries except the following.

Sample ID	Surrogate	%R	Qualifier
1	DCB1/DCB2	17%/18%	J/UJ
2	DCB1/DCB2	20%/28%	
4	DCB1/DCB2	23%/29%	
6	DCB1/DCB2	23%/29%	
8	DCB1/DCB2	20%/22%	
9	TCX1/DCB1/DCB2	28%/12%/14%	
9DL	TCX1/DCB1/DCB2	29%/17%/26%	None - Dilution Results
10	TCX1/DCB1/DCB2	28%/12%/15%	J/UJ
10DL	DCB1/DCB2	21%/27%	None - Dilution Results
11	DCB1/DCB2	10%/12%	J/UJ
11DL	DCB1/DCB2	22%/28%	None - Dilution Results
12	DCB1/DCB2	15%/18%	J/UJ
13	DCB1/DCB2	12%/16%	
20	TCX1/DCB1/DCB2	29%/20%/26%	
22	DCB1	27%	

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values except the following.

MS/MSD Sample ID	Compound	MS %R/MSD %R/ RPD	Qualifier
11	Aroclor-1016	897%/982%/OK	None - See Surrogates
	Aroclor-1260	6%/17%/93	
11RE	Aroclor-1016	582%/644%/OK	
	Aroclor-1260	8%/20%/86	

Laboratory Control Samples

- The LCS sample exhibited acceptable %R values.

Compound Quantitation

- Several samples exhibited high concentrations of PCBs which were flagged (E) by the laboratory indicating calibration range exceedences. The laboratory diluted and reanalyzed these samples and the dilution results for these PCBs should be used for reporting purposes.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

PCBs				
Compound	LMR13-43-024 ug/kg	LMR13-43-024FD ug/kg	RPD	Qualifier
Aroclor-1242	1000	940	6%	None
Aroclor-1254	1300	1800	32%	
Aroclor-1260	170	170	0%	

GC Column Difference Results

- Several samples exhibited high %D values > 25% between columns and have been qualified as estimated (J) by the reviewer.

Metals & Mercury

Holding Times

- All samples were prepared and analyzed within 28 days for mercury and 180 days for all other metals.

ICP/MS Tuning

- Not applicable.

Initial Calibration Verification

- All initial calibration criteria were met.

Continuing Calibration Verification

- All continuing calibration criteria were met.

Method Blank

- The method blanks were free of contamination.

Field Blank

- Field QC samples were not analyzed.

ICP Interference Check Sample

- The ICP interference check sample exhibited acceptable %R values.

Laboratory Control Samples

- The LCS sample exhibited acceptable recoveries.

Matrix Spike Analysis

- The matrix spike sample exhibited acceptable %R values.

Duplicate Sample Analysis

- The duplicate sample exhibited acceptable RPD values.

ICP Serial Dilution

- ICP serial dilution percent differences (%D) were within acceptance limits except the following.

ICP Sample ID	Compound	%D	Qualifier	Affected Samples
1	Cadmium	11%	J	1, 2, 4-6, 8-12, 15
	Chromium	12%	J	
	Nickel	15%	J	
	Zinc	12%	J	
20	Cadmium	16%	J	19, 20, 21, 23, 25, 26
	Chromium	17%	J	
	Copper	11%	J	
	Nickel	21%	J	
	Zinc	17%	J	

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

Metals				
Compound	LMR13-43-024 mg/kg	LMR13-43-024FD mg/kg	RPD	Qualifier
Arsenic	15.5	14.8	5%	None
Cadmium	15.4	13.7	12%	
Chromium	318	291	9%	
Copper	169	158	7%

Zinc	48.8	45.9	6%	
Mercury	0.065	0.15	79%	

Oil & Grease, Total Organic Carbon, AVS/SEM (Metals & Hg)

Holding Times

- All samples were analyzed within the recommended holding time for each analysis.

Initial and Continuing Calibration

- All %R criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
240-90545/1-A	HEM	191.0	None	All >5X
240-91121/1-A	HEM	116.8	U	16, 17

Field Blank

- Field QC samples were not included in this data package.

Laboratory Control Samples

- The LCS samples exhibited acceptable %R values.

Matrix Spike/Duplicate (MS/DUP) Recoveries

- The MS/MSD samples exhibited acceptable %R and RPD values except the following.

MS/DUP Sample ID	Compound	MS %R/RPD	Qualifier	Affected Samples
12 (Batch 90545)	HEM	216%/64	J	1-9, 11-15
16 (Batch 91530)	HEM	OK/29	None	Sample ND

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for eighteen sediment samples collected on June 12, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOCs	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis

- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in two samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Semivolatile Organic Compounds (SVOCs)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met except the following.

ICAL Date	Compound	%RSD/RRF	Qualifier	Affected Samples
07/24/13	2,4-Dinitrophenol	34.2%	J/UJ	9

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
07/15/13 (1414)	Pentachlorophenol	28.6%	J/UJ	8, 17
07/15/13 (2359)	Hexachlorocyclopentadiene	50.8%	J/UJ	
07/16/13 (2141)	Hexachlorocyclopentadiene	72.8%	J/UJ	10-16
07/18/13 (0108)	Hexachlorocyclopentadiene	85.9%	J/UJ	7
07/27/13 (0926)	Indeno(1,2,3-cd)pyrene	29.2%	J/UJ	9
	Dibenzo(a,h)anthracene	25.7%	J/UJ	
	Benzo(g,h,i)perylene	31.4%	J/UJ	
07/27/13 (1931)	Hexachlorocyclopentadiene	67.6%	J/UJ	

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKL5	Butylbenzylphthalate	15	U	1, 2, 15, 17
	bis(2-Ethylhexyl)phthalate	30	U	1, 2, 10, 12-17

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values except the following.

Sample ID	Surrogate	%R	Qualifier
1	Phenol-d5	106%	J - Positive Results
	4-Chloroaniline-d4	0%	R - Associated Compounds
2	Phenol-d5	105%	J - Positive Results
	4-Chloroaniline-d4	0%	R - Associated Compounds
17	Phenol-d5	107%	J - Positive Results
	4-Methylphenol-d8	113%	
Several	Several	Diluted*	Dilution Results Not Valid

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values except the following.

MS/MSD Sample ID	Compound	MS %R/MSD %R/ RPD	Qualifier
14	Pyrene	OK/10%/115	J

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- Several samples were analyzed at a dilution due to high concentrations of target compounds. No action was required.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

SVOC				
Compound	LMR13-46-024 ug/kg	LMR13-46-024FD ug/kg	RPD	Qualifier

Polynuclear Aromatic Hydrocarbons (PAH 34)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met.

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
07/30/13 (0925)	Dibenzo(a,h)anthracene	31.2%	J/UJ	10DL, 11DL

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKL5	Naphthalene	0.37	U	10DL, 11DL
	1-Methylnaphthalene	0.090	U	
	2-Methylnaphthalene	0.12	U	
	Fluoranthene	0.11	None	All >5X
	Pyrene	0.11	None	
	Benzo(a)anthracene	0.084	None	
	Chrysene	0.11	None	
	Benzo(b)fluoranthene	0.13	None	
	Benzo(k)fluoranthene	0.12	None	

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values except the following.

Sample ID	Surrogate	%R	Qualifier
10DL	Fluoranthene-d10	Diluted*	Dilution Results Not Valid
	2-Methylnaphthalene-d10	Diluted*	
11DL	Fluoranthene-d10	Diluted*	
	2-Methylnaphthalene-d10	Diluted*	

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- A MS/MSD sample was not analyzed.

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- EDS Sample IDs #10 and 11 exhibited high concentrations of several target compounds and were flagged (E) by the laboratory. Theses samples were reanalyzed at a dilution and the dilution results should be used for these compounds. Several of the compounds remained flagged (E) in the dilution analysis and these results were qualified estimated (J).
- Total 16 PPAH and Total PAH were estimated (J) in all samples due to blank contamination.

Field Duplicate Sample Precision

- Field duplicate samples were not analyzed.

Polychlorinated Biphenyls (PCBs)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days.

Initial Calibration

- All %RSD and/or correlation coefficient criteria were met.

Continuing Calibration

- All %D criteria were met.

Method Blank

- The method blanks were free of contamination.

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate recoveries except the following.

Sample ID	Surrogate	%R	Qualifier
3	DCB1/DCB2	12%/13%	J/UJ
4	DCB1/DCB2	10%/13%	
6	DCB1/DCB2	13%/17%	
7	TCX1/DCB1/DCB2	25%/16%/19%

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values.

Laboratory Control Samples

- The LCS sample exhibited acceptable %R values.

Compound Quantitation

- EDS Sample ID #7 contained high concentrations of target compounds and should have been flagged (E) by the laboratory. The sample was reanalyzed at a 4X dilution and the dilution results for these compounds should be used for reporting purposes
- EDS Sample ID #8 contained high concentrations of target compounds and were flagged (E) by the laboratory. The sample was reanalyzed at a 20X dilution and the dilution results for these compounds should be used for reporting purposes.
- EDS Sample ID #9 contained high concentrations of target compounds and was flagged (E) by the laboratory. The sample was reanalyzed at a 10X dilution and the dilution results for these compounds should be used for reporting purposes.

Field Duplicate Sample Precision

- Field duplicate samples were not analyzed.

GC Column Difference Results

- Several samples exhibited high %D values > 25% between columns and have been qualified as estimated (J) by the reviewer.

Metals & Mercury

Holding Times

- All samples were prepared and analyzed within 28 days for mercury and 180 days for all other metals.

ICP/MS Tuning

- Not applicable.

Initial Calibration Verification

- All initial calibration criteria were met.

Continuing Calibration Verification

- All continuing calibration criteria were met.

Method Blank

- The method blanks were free of contamination.

Field Blank

- Field QC samples were not analyzed.

ICP Interference Check Sample

- The ICP interference check sample exhibited acceptable %R values.

Laboratory Control Samples

- The LCS sample exhibited acceptable recoveries.

Matrix Spike/Duplicate (MS/DUP) Analysis

- The MS/DUP samples exhibited acceptable %R and RPD values.

ICP Serial Dilution

- ICP serial dilution percent differences (%D) were within acceptance limits except the following.

ICP Sample ID	Compound	%D	Qualifier	Affected Samples
16	Chromium	16%	J	All Samples
	Copper	14%	J	
	Nickel	20%	J	
	Zinc	18%	J	

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate samples were not analyzed.

Oil & Grease, Total Organic Carbon, AVS/SEM (Metals & Hg)

Holding Times

- All samples were analyzed within the recommended holding time for each analysis.

Initial and Continuing Calibration

- All %R criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
240-90545/1-A	HEM	191.0	U	14, 15, 16

Field Blank

- Field QC samples were not included in this data package.

Laboratory Control Samples

- The LCS samples exhibited acceptable %R values.

Matrix Spike/Duplicate (MS/DUP) Recoveries

- The MS/DUP samples exhibited acceptable %R and RPD values.

Compound Quantitation

- Several samples were analyzed at a dilution due to high concentrations of target compounds.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

HEM				
Compound	LMR13-46-024 mg/kg	LMR13-46-024FD mg/kg	RPD	Qualifier
HEM	11700	13300	13%	None

AVS/SEM				
Compound	LMR13-81-012 mg/kg	LMR13-81-012FD mg/kg	RPD	Qualifier

Senior Chemist

Data Qualifiers

U	=	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.
UJ	=	The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.
J	=	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).
J+	=	The result is an estimated quantity, but the result may be biased high.
J-	=	The result is an estimated quantity, but the result may be biased low.
R	=	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
NJ	=	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-five sediment samples collected on June 13, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOC	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in ten samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Semivolatile Organic Compounds (SVOC)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met except the following.

ICAL Date	Compound	%RSD/RRF	Qualifier	Affected Samples
06/26/13	Fluoranthene	21.6%	J/UJ	All Samples

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
07/11/13 (0858)	Fluoranthene	32.0%	None	See ICAL
	Benzo(g,h,i)perylene	30.9%	J/UJ	6, 9, 10-14
07/11/13 (1754)	Hexachlorocyclopentadiene	68.2%	J/UJ Unless R due to Surrogate	
	4-Nitrophenol	50.6%	J/UJ	
07/17/13 (1209)	Pentachlorophenol	27.9%	J/UJ	15-17, 19-22
07/17/13 (1837)	Hexachlorocyclopentadiene	67.4%	J/UJ Unless R due to Surrogate	
07/18/13 (1539)	Hexachlorocyclopentadiene	61.0%	J/UJ Unless R due to Surrogate	4, 5, 18, 24
07/19/13 (0828)	n-Nitroso-di-n-propylamine	28.3%	J/UJ	1-3, 23
	4-Bromophenyl-phenylether	28.5%	J/UJ	
07/19/13 (1218)	Hexachlorocyclopentadiene	50.2%	J/UJ	1-3, 23

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKL7	bis(2-Ethylhexyl)phthalate	33	U	24

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values except the following.

Sample ID	Surrogate	%R	Qualifier
5	4-Chloroaniline-d5	0%	R- Associated Compounds
9	4-Chloroaniline-d5	0%	
10	4-Chloroaniline-d5	0%	
12	4-Methylphenol-d8	101%	J – Associated Positive Results
	4-Chloroaniline-d5	0%	R- Associated Compounds
14	4-Methylphenol-d8	101%	None – Associated Cmpds ND
15	4-Methylphenol-d8	104%	
	4-Chloroaniline-d5	0%	R- Associated Compounds
16	4-Methylphenol-d8	103%	None – Associated Cmpds ND
	Acenaphthylene-d8	98%	
	Anthracene-d10	100%	
17	4-Chloroaniline-d5	0%	R- Associated Compounds
19	4-Chloroaniline-d5	0%	
20	4-Methylphenol-d8	120%	J – Associated Positive Results
	Nitrobenzene-d5	106%	None – Associated Cmpds ND
	4-Chloroaniline-d5	0%	R- Associated Compounds
	Acenaphthylene-d8	113%	J – Associated Positive Results
	Anthracene-d10	109%	
21	4-Chloroaniline-d5	0%	R- Associated Compounds
24	4-Chloroaniline-d5	0%	

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- A MS/MSD sample was not analyzed.

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria except the following.

Sample ID	Internal Standard	Area Count	Qualifier
20	Perylene-d12	Low	J/UJ – Associated Compounds
20RE*	Perylene-d12	Low	
22	Perylene-d12	Low	
22RE*	Perylene-d12	Low	

* EDS Sample IDs # 20 and 22 were reanalyzed with similar results. The raw data was reported in the data package, but there are no Form Is for the reanalysis. Use the original results for reporting purposes.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- Several samples were analyzed at various dilutions due to high concentrations of target compounds. No action was required.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

SVOC				
Compound	LMR13-93-024 ug/kg	LMR13-93-024FD ug/kg	RPD	Qualifier
Naphthalene	260	150	54%	None
Acenaphthene	190	200	5%

Polynuclear Aromatic Hydrocarbons (PAH 34)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met.

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
07/30/13 (0925)	Dibenzo(a,h)anthracene	31.2%	J/UJ	10, 21

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKM3	Naphthalene	0.15	U	20
	Fluoranthene	0.20	None	All >5X
	Pyrene	0.16	None	
	Benzo(a)anthracene	0.12	None	
	Chrysene	0.14	None	
	Benzo(b)fluoranthene	0.14	None	
	Benzo(k)fluoranthene	0.12	None	
	Benzo(e)pyrene	0.094	None	
	Total 16 PPAH	1.0	J	20
	Total PAH	1.1	J	
SBLKL6	Naphthalene	0.26	U	10
	2-Methylnaphthalene	0.086	U	10, 21
	Phenanthrene	0.093	U	10
	Fluoranthene	0.11	None	All >5X
	Pyrene	0.10	None	
	Total 16 PPAH	0.57	J	10, 21
	Total PAH	0.57	J	

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKL7	Naphthalene	0.16	U	24
SBLKL7	Total 16 PPAH	0.16	J	24
	Total PAH	0.16	J	

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- A MS/MSD sample was not analyzed.

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- EDS Sample ID #20 exhibited high concentrations of several target compounds and were flagged (E) by the laboratory. However, a dilution analysis was not performed and these compounds were qualified estimated (J).
- Total 16 PPAH and Total PAH were estimated (J) in all samples due to blank contamination.

Field Duplicate Sample Precision

- Field duplicate samples were not analyzed.

Polychlorinated Biphenyls (PCBs)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days.

Initial Calibration

- All %RSD and/or correlation coefficient criteria were met.

Continuing Calibration

- All %D criteria were met.

Method Blank

- The method blanks were free of contamination.

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate recoveries except the following.

Sample ID	Surrogate	%R	Qualifier
2	DCB1	26%	J/UJ

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- A MS/MSD sample was not analyzed.

Laboratory Control Samples

- The LCS sample exhibited acceptable %R values.

Compound Quantitation

- Several samples exhibited high concentrations of PCBs which were flagged (E) by the laboratory indicating calibration range exceedences. The laboratory diluted and reanalyzed these samples and the dilution results for these PCBs should be used for reporting purposes.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

PCBs				
Compound	LMR13-62-024FD ug/kg	LMR13-62-024 ug/kg	RPD	Qualifier
None	ND	ND	-	-

PCBs				
Compound	LMR13-90-024FD ug/kg	LMR13-90-024 ug/kg	RPD	Qualifier
Aroclor-1248	63	42	40%	None
Aroclor-1254	43	29	39%	
Aroclor-1260	10	7.4	30%	

GC Column Difference Results

- Several samples exhibited high %D values > 25% between columns and have been qualified as estimated (J) by the reviewer.

Metals & Mercury

Holding Times

- All samples were prepared and analyzed within 28 days for mercury and 180 days for all other metals.

ICP/MS Tuning

- Not applicable.

Initial Calibration Verification

- All initial calibration criteria were met.

Continuing Calibration Verification

- All continuing calibration criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
PBSE6	Zinc	1.3	None	All >10X
PBSE7	Zinc	0.78	None	

Field Blank

- Field QC samples were not analyzed.

ICP Interference Check Sample

- The ICP interference check sample exhibited acceptable %R values.

Laboratory Control Samples

- The LCS sample exhibited acceptable recoveries.

Matrix Spike Analysis

- The matrix spike sample exhibited acceptable %R values.

Duplicate Sample Analysis

- The duplicate sample exhibited acceptable RPD values.

ICP Serial Dilution

- ICP serial dilution percent differences (%D) were within acceptance limits except the following.

ICP Sample ID	Compound	%D	Qualifier	Affected Samples
20	Chromium	16%	J	All Samples
	Copper	13%	J	
	Nickel	21%	J	
	Zinc	18%	J	

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

Metals				
Compound	LMR13-62-024FD mg/kg	LMR13-62-024 mg/kg	RPD	Qualifier
Arsenic	5.0	6.3	23%	None

Oil & Grease, Total Organic Carbon, AVS/SEM (Metals & Hg)

Holding Times

- All samples were analyzed within the recommended holding time for each analysis.

Initial and Continuing Calibration

- All %R criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
240-91726/1-A	HEM	197.8	None	All >5X
240-91908/1-A	HEM	100.3	U	18, 19, 21, 25

Field Blank

- Field QC samples were not included in this data package.

Laboratory Control Samples

- The LCS samples exhibited acceptable %R values.

Matrix Spike/Duplicate (MS/DUP) Recoveries

- A MS/MSD sample was not analyzed.

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

Senior Chemist

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-five sediment samples collected on June 13, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOC	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn

Analysis	*Method References*
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in sixteen samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Semivolatile Organic Compounds (SVOC)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met.

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
07/18/13 (0108)	Hexachlorocyclopentadiene	85.9%	J/UJ Unless R due to Surrogates	3-11
07/19/13 (0052)	Hexachlorocyclopentadiene	71.6%	J/UJ Unless R due to Surrogates	1, 2, 12, 13, 16, 18-21, 23, 24
	2,4-Dinitrophenol	54.3%	J/UJ	
	Pentachlorophenol	59.9%	J/UJ	
07/20/13 (1051)	Hexachlorocyclopentadiene	66.8%	None - See Surrogates	15
	Pentachlorophenol	50.2%	J/UJ	

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKL7	Butylbenzylphthalate	18	U	3-12, 18-20
	bis(2-Ethylhexyl)phthalate	55	U	3-6, 9, 18-20
SBLKL8	Butylbenzylphthalate	29	U	21, 23, 24
	bis(2-Ethylhexyl)phthalate	83	U	

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values except the following.

Sample ID	Surrogate	%R	Qualifier
1	4-Chloroaniline-d4	0%	R - Associated Compounds
	Pyrene-d10	49%	J/UJ - Associated Compounds
2	4-Chloroaniline-d4	0%	R - Associated Compounds
3	4-Methylphenol-d8	103%	None - ND
	4-Chloroaniline-d4	0%	R - Associated Compounds
4	4-Chloroaniline-d4	0%	R - Associated Compounds
5	Phenol-d5	111%	J - Positive Associated Compounds
	4-Methylphenol-d8	111%	None- ND
	4-Chloroaniline-d4	0%	R - Associated Compounds
6	4-Chloroaniline-d4	0%	R - Associated Compounds
8	4-Methylphenol-d8	102%	None - ND
9	4-Chloroaniline-d4	0%	R - Associated Compounds
10	Phenol-d5	109%	J - Positive Associated Compounds
	4-Methylphenol-d8	106%	None - ND
	4-Chloroaniline-d4	0%	R - Associated Compounds
11	4-Chloroaniline-d4	0%	R - Associated Compounds
12	Phenol-d5	108%	J - Positive Associated Compounds
	4-Methylphenol-d8	108%	
	4-Chloroaniline-d4	0%	R - Associated Compounds
15	4-Chloroaniline-d4	0%	R - Associated Compounds
18	4-Chloroaniline-d4	0%	R - Associated Compounds
19	4-Chloroaniline-d4	0%	R - Associated Compounds
20	4-Chloroaniline-d4	0%	R - Associated Compounds
21	Phenol-d5	106%	J - Positive Associated Compounds
23	4-Chloroaniline-d4	0%	R - Associated Compounds
24	4-Chloroaniline-d4	0%	R - Associated Compounds

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values except the following.

MS/MSD Sample ID	Compound	MS %R/MSD %R/ RPD	Qualifier
2	Pentachlorophenol	0%/0%/OK	Results Not Valid - 5X Dilution

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria except the following.

Sample ID	Internal Standard	Area Count	Qualifier
2	IS5=Chrysene-d12	Low	J/UJ - Associated Compounds
	IS6=Perylene-d12	Low	

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- Several samples were analyzed at various dilutions due to high concentrations of target compounds. No action was required.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

SVOC				
Compound	LMR13-63-024 ug/kg	LMR13-63-024FD ug/kg	RPD	Qualifier
Benzaldehyde	70	58	19%	None
Acetophenone	36	21	53%	
Naphthalene	27	30	11%

Polynuclear Aromatic Hydrocarbons (PAH 34)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met.

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
07/30/13	Dibenzo(a,h)anthracene	31.2%	J/UJ	18, 24

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKL7	Naphthalene	0.16	U	18
	Total 16 PPAH	0.16	J	
	Total PAH	0.16	J	
SBLKL8	Naphthalene	0.17	U	24
	Phenanthrene	0.17	None	All >5X
	Total 16 PPAH	0.35	J	24
	Total PAH	0.35	J	

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values.

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- Total 16 PPAH and Total PAH were estimated (J) in all samples due to blank contamination.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

PAH 34				
Compound	LMR13-51-012 ug/kg	LMR13-51-012FD ug/kg	RPD	Qualifier

C2 Chyrsenes	110	150	31%	
C3 Chyrsenes	50	72	36%	
C4 Chyrsenes	16	23	36%	
Total 16 PPAH	1700	2100	21%	
Total PAH	4100	5200	24%	

Polychlorinated Biphenyls (PCBs)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days.

Initial Calibration

- All %RSD and/or correlation coefficient criteria were met.

Continuing Calibration

- All %D criteria were met.

Method Blank

- The method blanks were free of contamination.

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate recoveries.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values except the following.

MS/MSD Sample ID	Compound	MS %R/MSD %R/ RPD	Qualifier
2	Aroclor-1016	509%/545%/OK	None – 5X Dilution
	Aroclor-1260	18%/17%/OK	

Laboratory Control Samples

- The LCS sample exhibited acceptable %R values.

Compound Quantitation

- Several samples were analyzed at a dilution. EDS Sample IDs 17 and 19 were analyzed at a 5X dilution even though all results were non-detect.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

PCBs				
Compound	LMR13-47-024 ug/kg	LMR13-47-024FD ug/kg	RPD	Qualifier
Aroclor-1242	29	30	%	None
Aroclor-1254	24	25	%	
Aroclor-1260	7.2	4.7	%	

PCBs				
Compound	LMR13-51-024 ug/kg	LMR13-51-024FD ug/kg	RPD	Qualifier
None	ND	ND	-	-

GC Column Difference Results

- Several samples exhibited high %D values > 25% between columns and have been qualified as estimated (J) by the reviewer.

Metals & Mercury

Holding Times

- All samples were prepared and analyzed within 28 days for mercury and 180 days for all other metals.

ICP/MS Tuning

- Not applicable.

Initial Calibration Verification

- All initial calibration criteria were met.

Continuing Calibration Verification

- All continuing calibration criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
MB	Zinc	0.78	None	All Associated >5X
	Zinc	0.26	None	
	Zinc	0.56	None	
	Mercury	0.30	None	

Field Blank

- Field QC samples were not analyzed.

ICP Interference Check Sample

- The ICP interference check sample exhibited acceptable %R values.

Laboratory Control Samples

- The LCS sample exhibited acceptable recoveries.

Matrix Spike Analysis

- The matrix spike sample exhibited acceptable %R values.

Duplicate Sample Analysis

- The duplicate sample exhibited acceptable RPD values.

ICP Serial Dilution

- ICP serial dilution percent differences (%D) were within acceptance limits except the following.

ICP Sample ID	Compound	%D	Qualifier	Affected Samples
2	Cadmium	15%	J	1-19, 22, 23
	Chromium	16%	J	
	Nickel	19%	J	
	Zinc	16%	J	
20	Chromium	15%	J	20, 21
	Zinc	14%	J	

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

Metals				
Compound	LMR13-47-024 mg/kg	LMR13-47-024FD mg/kg	RPD	Qualifier
Arsenic	7.3	7.8	7%	None
Cadmium	0.82	0.83	1%	
Chromium	27.4	28.4	4%	
Copper	28.4	30.6	7%	
Lead	23.5	25.8	9%	
Nickel	30.0	32.9	9%	
Zinc	118	128	8%	
Mercury	0.11	0.094	16%	

Metals				
Compound	LMR13-51-024 mg/kg	LMR13-51-024FD mg/kg	RPD	Qualifier
Arsenic	6.5	6.1	6%	None
Cadmium	0.57	0.49	15%	
Chromium	25.7	22.5	13%	
Copper	23.7	22.0	7%	
Lead	22.5	29.3	26%	
Nickel	30.2	28.4	6%	
Zinc	110	91.0	19%	
Mercury	0.20	0.19	5%	

Oil & Grease, Total Organic Carbon, AVS/SEM (Metals & Hg)

Holding Times

- All samples were analyzed within the recommended holding time for each analysis.

Initial and Continuing Calibration

- All %R criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
240-91726/1-A	HEM	197.8	U	7-11, 18
240-91908/1-A	HEM	100.3	None	All Associated >5X

Field Blank

- Field QC samples were not included in this data package.

Laboratory Control Samples

- The LCS samples exhibited acceptable %R values.

Matrix Spike/Duplicate (MS/DUP) Recoveries

- The MS/MSD samples exhibited acceptable %R and RPD values.

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

TOC				
Compound	LMR13-63-120 mg/kg	LMR13-63-120FD mg/kg	RPD	Qualifier

Senior Chemist

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for twenty-four sediment samples collected on June 14, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOC	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis

- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in seven samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Semivolatile Organic Compounds (SVOC)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met except the following

ICAL Date	Compound	%RSD/RRF	Qualifier	Affected Samples
07/29/13	Pentachlorophenol	21.2%	J/UJ	2, 2RE, 4, 5, 5RE, 6, 7, 7RE, 8
	Pyrene	22.6%	J/UJ	

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
07/21/13 (1253)	4-Methylphenol	29.9%	J/UJ	23, 24
	n-Nitroso-di-n-propylamine	33.8%	J/UJ	
07/21/13 (2241)	Hexachlorocyclopentadiene	58.3%	None	See Surrogate
	di-n-Octylphthalate	51.8%	J/UJ	23, 24
07/27/13 (0926)	Indeno(1,2,3-cd)pyrene	29.2%	J/UJ	1, 9-13
	Pyrene	29.2%	J/UJ	
	Dibenzo(a,h)anthracene	25.7%	J/UJ	
07/27/13 (2014)	Benzo(g,h,i)perylene	31.4%	J/UJ Unless R due to Surrogates	1, 9-13
	Pentachlorophenol	50.2%		
	Hexachlorocyclopentadiene	66.5%		
07/29/13 (0752)	Pentachlorophenol	32.6%	J/UJ	14, 16-22
07/29/13 (1753)	Hexachlorocyclopentadiene	76.3%	J/UJ Unless R due to Surrogates	14, 16-22
07/29/13 (1833)	2,4-Dinitrophenol	50.2%	J/UJ	14, 16-22
07/31/13 (0923)	Fluoranthene	30.8%	J/UJ	2, 4-7, 8
07/31/13 (1710)	Hexachlorocyclopentadiene	56.9%	J/UJ Unless R due to Surrogates	2, 4-7, 8
08/02/13 (0617)	Dibenzo(a,h)anthracene	25.1%	J/UJ	2RE, 5RE, 7RE
08/02/13 (1349)	Hexachlorocyclopentadiene	55.2%	J/UJ	2RE, 5RE, 7RE

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLK9L	di-n-Butylphthalate	6.2	None	All Associated ND
	Butylbenzylphthalate	13	None	
	bis(2-Ethylhexyl)phthalate	31	U	8
SBLKL9	Butylbenzylphthalate	26	U	9-14, 16-24
	bis(2-Ethylhexyl)phthalate	46	U	9-11, 13, 14, 16, 17, 19-24

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values except the following.

Sample ID	Surrogate	%R	Qualifier
1	4-Chloroaniline-d4	0%	R – Associated Compounds
2	4-Chloroaniline-d4	0%	R – Associated Compounds
2RE	4-Chloroaniline-d4	0%D	R – Associated Compounds
4	4-Methylphenol-d8	105%	None – All Associated ND
	4-Chloroaniline-d4	0%	J/R – Associated Compounds
7	Dimethylphthalate-d6	36%D	None – Dilution
	Fluorene-d10	31%D	

7 (cont)	Pyrene-d10	28%	None- Dilution
	Benzo(a)pyrene-d12	36%	
7RE	Dimethylphthalate-d6	37%D	None- Dilution
	Fluorene-d10	29%D	
	Pyrene-d10	29%D	
	Benzo(a)pyrene-d12	33%D	
	4-Methylphenol-d8	135%D	
9	4-Methylphenol-d8	111%	None – All Associated ND
12	Pyrene-d10	48%	J/UJ – Associated Compounds
14	Benzo(a)pyrene-d12	30%	J/UJ - Associated Compounds
16	4-Chloroaniline-d4	0%	R – Associated Compounds
22	4-Chloroaniline-d4	0%	R – Associated Compounds
23	4-Chloroaniline-d4	0%	R – Associated Compounds
24	Phenol-d5	111%	J – Associated Positive Results
	4-Chloroaniline	0%	R – Associated Compounds

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values except the following.

MS/MSD Sample ID	Compound	MS %R/MSD %R/ RPD	Qualifier
4	Pyrene	OK/172%/OK	None – Sample Analyzed at 5X Dilution

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria except the following.

Sample ID	Internal Standard	Area Count	Qualifier
2	IS4=Phenanthrene-d10	Low	J/UJ – Associated Compounds
2RE	IS3=Acenaphthalene-d10	Low	J/UJ – Unless R due to Surrogates
	IS4=Phenanthrene-d10	Low	
	IS6=Perylene-d12	Low	
4	IS4=Phenanthrene-d10	Low	J/UJ – Associated Compounds
	IS6=Perylene-d12	Low	
5	IS4=Phenanthrene-d10	Low	
	IS6=Perylene-d12	Low	
5RE	IS4=Phenanthrene-d10	Low	
	IS6=Perylene-d12	Low	
7	IS4=Phenanthrene-d10	Low	
7RE	IS4=Phenanthrene-d10	Low	
	IS6=Perylene-d12	Low	

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- Several samples were analyzed at various dilutions due to high concentrations of target compounds. No action was required.
- Several samples were reanalyzed due to IS or surrogate deficiencies. See Form Is for which results to report.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

SVOC				
Compound	LMR13-50-024 ug/kg	LMR13-50-024FD ug/kg	RPD	Qualifier
Benzaldehyde	52	70	30%	None
Acenaphthene	360U	16	NC	
Fluorene	360U	27	NC	
Phenanthrene	130	160	21%	
Anthracene	29	33	13%	
Carbazole	15	350U	NC	
di-n-Butylphthalate	24	20	18%	
Fluoranthene	300	290	3%	
Pyrene	310	320	3%	
Benzo(a)anthracene	120	110	9%	
Chrysene	190	200	5%	
Benzo(b)fluoranthene	160	140	13%	
Benzo(k)fluoranthene	140	160	13%	
Benzo(a)pyrene	130	120	8%	
Indeno(1,2,3-cd)pyrene	83	79	5%	
Dibenzo(a,h)anthracene	46	350U	NC	
Benzo(g,h,i)perylene	130	97	29%

Polynuclear Aromatic Hydrocarbons (PAH 34)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met.

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
07/29/13 (0806)	Indeno(1,2,3-cd)pyrene	26.6%	None	None - Dilution Used
	Dibenzo(a,h)anthracene	37.6%	J/UJ	13

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKL9	Naphthalene	0.21	U	1, 8, 13 13DL
	2-Methylnaphthalene	0.092	U	1, 8, 13DL
	Fluoranthene	0.39	None	All >5X
	Pyrene	0.42	None	
	Benzo(a)anthracene	0.25	None	
	Chrysene	0.24	None	
	Benzo(b)fluoranthene	0.17	None	
	Benzo(k)fluoranthene	0.17	None	
	Benzo(a)pyrene	0.13	None	
	Benzo(e)pyrene	0.12	None	
	Perylene	0.29	None	
	Total 16 PPAH	2.2	J	1, 8, 13, 13DL
	Total PAH	2.6	J	

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- A MS/MSD sample was not analyzed.

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- EDS Sample ID #13 exhibited high concentrations of several target compounds and were flagged (E) by the laboratory. The sample was reanalyzed at a 14.3X dilution and the dilution results should be used for these compounds. Several of the compounds remained flagged (E) in the dilution analysis and these results were qualified estimated (J).
- EDS Sample ID #22 exhibited high concentrations of several target compounds and were flagged (E) by the laboratory. However, a dilution analysis was not performed and these compounds were qualified estimated (J).
- Total 16 PPAH and Total PAH were estimated (J) in all samples due to blank contamination.

Field Duplicate Sample Precision

- Field duplicate samples were not analyzed.

Polychlorinated Biphenyls (PCBs)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days.

Initial Calibration

- All %RSD and/or correlation coefficient criteria were met.

Continuing Calibration

- All %D criteria were met.

Method Blank

- The method blanks were free of contamination.

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate recoveries except the following.

Sample ID	Surrogate	%R	Qualifier
2	TCX1/TCX2/DCB1/DCB2	26%/OK/11%/16%	J/UJ

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- A MS/MSD sample was not analyzed.

Laboratory Control Samples

- The LCS sample exhibited acceptable %R values.

Compound Quantitation

- EDS Sample ID #2 exhibited low surrogate %R values. The sample was reanalyzed at a 3X dilution with acceptable surrogate values. Use the reanalysis results for reporting purposes.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

PCBs				
Compound	LMR13-45-024DL ug/kg	LMR13-45-024FD ug/kg	RPD	Qualifier
Aroclor-1242	140	170	19%	None
Aroclor-1254	120	160	29%	
Aroclor-1260	52	65	22%	

PCBs				
Compound	LMR13-49-024 ug/kg	LMR13-49-024FD ug/kg	RPD	Qualifier
Aroclor-1248	61	68	11%	None
Aroclor-1254	51	77	41%	
Aroclor-1260	12	14	15%	

GC Column Difference Results

- Several samples exhibited high %D values > 25% between columns and have been qualified as estimated (J) by the reviewer.

Metals & Mercury

Holding Times

- All samples were prepared and analyzed within 28 days for mercury and 180 days for all other metals.

ICP/MS Tuning

- Not applicable.

Initial Calibration Verification

- All initial calibration criteria were met.

Continuing Calibration Verification

- All continuing calibration criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
PBSE8	Copper	0.67	None	All Associated >10X
	Nickel	0.30	None	
	Zinc	0.26	None	
PBSF2	Chromium	0.091	None	
	Lead	0.25	None	
	Zinc	0.99	None	

Field Blank

- Field QC samples were not analyzed.

ICP Interference Check Sample

- The ICP interference check sample exhibited acceptable %R values.

Laboratory Control Samples

- The LCS sample exhibited acceptable recoveries.

Matrix Spike Analysis

- The matrix spike sample exhibited acceptable %R values.

Duplicate Sample Analysis

- The duplicate sample exhibited acceptable RPD values.

ICP Serial Dilution

- ICP serial dilution percent differences (%D) were within acceptance limits except the following.

ICP Sample ID	Compound	%D	Qualifier	Affected Samples
20	Chromium	20%	J	All Samples
	Zinc	17%	J	

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

Metals				
Compound	LMR13-45-024 mg/kg	LMR13-45-024FD mg/kg	RPD	Qualifier
Arsenic	18.1	19.2	6%	None
Cadmium	4.4	4.7	7%	
Chromium	220	235	7%	
Copper	118	131	10%	
Lead	95.8	101	5%	
Nickel	135	140	4%	
Zinc	1160	1210	4%	
Mercury	0.13	0.55	124%	

Metals				
Compound	LMR13-49-024 mg/kg	LMR13-49-024FD mg/kg	RPD	Qualifier
Arsenic	6.6	6.6	0%	None
Cadmium	1.3	1.2	8%	

Metals				
Compound	LMR13-49-024 mg/kg	LMR13-49-024FD mg/kg	RPD	Qualifier
Chromium	20.4	20.5	0%	None
Copper	23.4	23.8	2%	
Lead	37.2	31.6	16%	
Nickel	24.2	24.2	0%	
Zinc	128	133	4%	
Mercury	0.12	0.12	0%	

Oil & Grease, Total Organic Carbon, AVS/SEM (Metals & Hg)

Holding Times

- All samples were analyzed within the recommended holding time for each analysis.

Initial and Continuing Calibration

- All %R criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
240-91121/1-A	HEM	116.8	U	19, 20, 21
240-91726/1-A	HEM	197.8	U	8, 9, 11, 12

Field Blank

- Field QC samples were not included in this data package.

Laboratory Control Samples

- The LCS samples exhibited acceptable %R values.

Matrix Spike/Duplicate (MS/DUP) Recoveries

- The MS/DUP samples exhibited acceptable %R and RPD values.

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

Senior Chemist

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
