ATTACHMENT C

DATA QUALIFIER DEFINITIONS

LABORATORY DATA QUALIFIER DEFITIONS

D - The reported result is from a dilution.

H - Indicates that the chromatographic fingerprint does resemble a petroleum product but the elution pattern indicates a greater amount of heavier molecular weight constituents than the calibration standard.

J - The result is an estimated value that was detected outside the quantitation range.

O - Indicates that the chromatographic fingerprint resembles an oil product, but does not match the calibration standard.

U - The analyte was analyzed for but not detected at or above the method detection limit and/or reporting limit

Y - Indicates that the chromatographic fingerprint resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.

DATA VALIDATION DATA QUALIFIER DEFITIONS

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the quantitation limit).

U - The analyte was analyzed for but not detected at a level equal to or greater than the reporting limit.

Re: Data Review of Total Organic Carbon Analyses
For Sediment Samples Collected on May 10-12, 2011
Duck and Otter Creeks Confluence Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2B-AOVS

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for sediment samples collected on May 10-12, 2011, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks Confluence Investigation (Duck and Otter) Site. This data review is for total organic carbon (TOC) analysis of 53 sediment samples that includes four field splits and four field duplicates that were collected by the WESTON Superfund Technical Assessment and Response Team (START). The samples were validated in accordance with the "Quality Assurance Project Plan (QAPP), Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, and QAPP Amendment 1 dated May 5, 2011, which includes using the U.S. EPA Contract Laboratory Program National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed by Columbia Analytical Services (CAS) located in Kelso, Washington, under the following three work orders:

- K1104187
- K1104250
- K1104355

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

The samples were analyzed for TOC using U.S. EPA SW-846 Method 9060. CAS provided WESTON with a staged electronic data deliverable (SEDD) that was used in conjunction with the Automated Data Review (ADR) software to assist in reviewing the data. All SEDDs were imported into the ADR software for review by the software program and all data was checked for completeness. Five percent of the data was put through a full data validation. Therefore, one of the work orders, K1104187, was selected for the full data validation. Work order K1104187 contained 7 sediment samples, including one field split for TOC analysis.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for work order K1104187. Attachment B to this report contains a printed report from ADR that provides a summary of results with qualifiers applied by the laboratory and the ADR program. Attachment C contains the data qualifier definitions. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF TOC DATA REVIEW

As stated above, five percent of the data was fully validated. Work order K1104187 was selected for full data validation. In work order K1104187, the holding times, method blanks, calibration standards, calibration blanks, laboratory duplicates, and laboratory control samples (LCS) were all within the QC limits. For the remaining work orders, the ADR program indicated that method blanks, laboratory duplicates, and laboratory control samples were all within QC limits. All sample results were based on a dry weight for the TOC analyses.

There was a minor problem with the recovery of a matrix spike duplicate (MSD) for which a sample result was qualified (see discussion under Minor Problems.

The QAPP stated that field splits (replicates) and field duplicate samples would be collected at a 5 percent frequency. There were a total of 45 field investigative samples and four field duplicates and four field splits collected. Therefore, the QAPP-stated frequency was met for the field duplicates and splits. A QC limit for field splits and field duplicates was not stated in the QAPP; therefore, a default QC limit of 50 relative percent difference (RPD) was used to evaluate field split and duplicate results. The RPDs for three field split and three field duplicate samples were below 50 percent. One field split and field duplicate sample exceeded this limit with an RPD of 86 and 170 percent, respectively. These exceedances indicate some heterogeneity associated with TOC sample results but in general field duplicate and split results were acceptable. Tables 2 and 3 summarize the field split and field duplicate results, respectively.

Below are a description of the minor problems with QC failures and a review of the data quality indicators.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

MS and MSDs. There were a total of three matrix spike (MS) and MSD pairs associated with the TOC analysis. The percent recoveries for all three MSs and two MSDs were within QC limits. The exception was the MSD using sample DC-20-03 as the spiked sample. This MSD had a percent recovery of 141 percent which is above the QC limit of 69 to 123 percent recovery. The TOC result in sample DC-20-03 was flagged "J" as estimated due to potential matrix interference in this sample.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The laboratory reporting limit of 0.05 percent TOC as stated in the QAPP was met for all samples. Sensitivity was acceptable.

Precision. Field precision is typically determined by evaluating the RPDs for the field split and field duplicate results. The mean RPD for field splits is 48 and for field duplicates is 42. The mean field split and duplicate RPDs indicate acceptable field precision. Table 4 summarizes the field precision results.

Laboratory precision was determined by evaluating the RPD values for MS/MSD samples and laboratory duplicates. The mean RPD for the laboratory duplicates is 9 and the mean RPD for MS/MSDs is 10. The RPDs are within the QAPP stated limits for precision. Table 4 summarizes the laboratory precision results. The laboratory precision is acceptable for the TOC analyses.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for percent recovery for MS/MSD and LCS results. Table 4 summarizes the accuracy estimates for the TOC analyses. The mean percent recovery for the MS/MSD samples is 114 percent and for the LCS samples is 101 percent. All mean percent recoveries are within the QAPP specified QC limits. Laboratory accuracy was acceptable.

The mean LCS recoveries do not indicate a bias (either high or low) for the TOC analyses.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, all QC indicator samples that were analyzed were mostly within control limits and a data qualifier was applied for and MSD being outside QC limits.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 312-424-3300.

Very truly yours,
Weston Solutions, Inc.

QA/QC ANALYSIS CHECKLIST FOR TOC FOR WORK ORDER K1104187

TOC BY SW-846 METHOD 9060

WORK ORDER # K1104187

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: GLNPO Duck and Otter Creeks Confluence Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: August 5, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals ____	PCBs _____	pH _____	TOC __X__
Dioxins/Furans _____	PAHs _____	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other _____

2. Were the target detection limits met for each parameter?

Yes X
No _____ (EXPLAIN)

The TOC analysis met the reporting limit stated in the QAPP of 0.05 percent (%).

3. Were the method blanks less than the established MDL for each parameter?

Yes X
No _____ (EXPLAIN)

The method blank did not contain TOC detections above the reporting limit.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes X
No _____ (EXPLAIN)

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Surrogates and internal standards do not apply to the TOC analysis.

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

The MS recovery was within QC limits but the MSD recovery was slightly elevated at a recovery of 141 percent. The TOC result in the parent sample, DC-20-03, was flagged "J" as estimated due to potential matrix interference in this sample. Other MS/MSD recoveries were acceptable and in general there does not seem to be an issue with matrix interference.

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

An LCS was analyzed with the TOC analysis and the recovery was within the QAPP-specified QC limit.

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes	X	
No		

The calibration blanks did not contain detections of TOC.

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

ICSs are not applicable to TOC analysis.

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Serial dilutions are not applicable to TOC analysis.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

Trip blanks and storage blanks are not applicable to this method.

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

The analyses were performed in the holding time limit of 28 days from collection to analysis.

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	X	
No		(EXPLAIN)

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

Dry weight concentrations were reported.

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “UNACCEPTABLE” marked above are described immediately following the “UNACCEPTABLE” marking in the corresponding item above.

The data are acceptable for use.

Re: Data Review of Semivolatile Organic Compounds (SVOC) Analysis
For Sediment Samples Collected on May 11-12, 2011
CLP Case No. 41260, SDG No. E0272
Duck and Otter Creeks Confluence Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2B-AOVS

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for the five percent of the sediment samples collected in May 2011 for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks Confluence Investigation Site. This data review is for SVOC analyses of eleven sediment samples that include one field duplicate sample that were collected by WESTON and analyzed under Sample Delivery Group (SDG) number E0272. The samples were validated in accordance with the "Quality Assurance Project Plan (QAPP), Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, and QAPP Amendment 1 dated May 5, 2011, which includes using the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed under the U.S. EPA CLP by KAP Technologies, Inc. (KAP) located in The Woodlands, Texas, under case number 41260. Because only five percent of data is to be validated, SDG number E0272 was selected for data validation.

Sediment samples were analyzed for SVOCs using U.S. EPA CLP Statement of Work (SOW) SOM01.2 which utilizes gas chromatography/mass spectrometry (GC/MS). Table 2 provides a list of the SVOCs that were analyzed. KAP did not provide a Staged Electronic Data Deliverable (SEDD) with the CLP analytical package. Therefore, the Automated Data Review (ADR) software was not utilized to assist in reviewing this data.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for SDG E0272. Attachment B to this report contains a printed summary report of sample results. Attachment C to this report contains a list of the data qualifiers associated with the sample results. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF SVOC DATA REVIEW

The holding times, method blanks, initial calibration, continuing calibration, method blank, surrogates, internal standards, instrument check, matrix spike (MS), and matrix spike duplicate (MSD) were within the QC limits. Sample results are based on dry weight.

The relative percent differences (RPD) were calculated for the one field duplicate pair associated with this SDG. A QC limit for field duplicates was not stated in the QAPP; therefore, a default QC limit of 50 RPD was used to evaluate field duplicate results. Table 3 summarizes the field duplicate results along with the calculated RPD values. The field duplicate RPDs were acceptable.

Below is a summary of the data quality indicators associated with the SVOC analysis for the sediment samples associated with SDG E0272.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures.

Sensitivity. The QAPP stated that method SOM01.2 would achieve a reporting limit of 170 to 330 micrograms per kilogram (µg/kg), dependent on the SVOC compound analyzed. The laboratory achieved the QAPP-stated reporting limits, when adjusted for dilution factor and percent moisture. Sensitivity was adequate for the SVOC analyses of sediment samples collected on May 11-12, 2011, that are associated with SDG E0272.

Precision. Field precision is determined by evaluating the RPDs for the field duplicate results. The RPD values for the field duplicates were below 50 RPD and are acceptable indicating good field precision.

Laboratory precision was evaluated by reviewing the RPD values between the MS and MSD results. The RPDs were within the QAPP-stated QC limits and ranged from 0 to 6 percent. Laboratory precision was acceptable for the SVOC analysis. Table 4 summarizes the laboratory precision results.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for MS/MSD results. The MS/MSD percent recoveries were within the QAPP QC limits. Table 4 summarizes the accuracy estimates for the SVOC analysis. The mean MS/MSD percent recoveries ranged from 67 to 90 percent. Laboratory accuracy was acceptable. The MS/MSD recoveries indicate a low bias associated with the SVOC analyses.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, the data are usable for comparison to the SVOC screening criteria stated in the QAPP. No qualifications were added to the samples during the data review. Definitions for the laboratory qualifications are included in Attachment C.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 847-918-4000.

Very truly yours,

Weston Solutions, Inc.

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: Duck and Otter Creeks Confluence Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: August 12, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals ____	PCBs _____	pH _____	TOC _____
Dioxins/Furans _____	SVOCs ___X___	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other _____

2. Were the target detection limits met for each parameter?

Yes X
No _____

When adjusted for dilution factor and percent moisture, the QAPP-stated reporting limits were met for SVOC compounds.

3. Were the method blanks less than the established MDL for each parameter?

Yes X
No _____ (EXPLAIN)

The method blank contained no detections of target analytes.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes	X	
No		(EXPLAIN)

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

LCSs are not analyzed with SVOC analysis by SOM01.2.

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Serial dilution is not applicable to SVOCs by SOM01.2.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

Trip blanks and storage blanks are not applicable to SW-846 Method 8270C.

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

Samples were analyzed within the holding time requirement of 14 days to extraction from sample collection and 40 days to analysis following extraction.

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Laboratory duplicates were not analyzed with the samples.

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

Dry-weight concentrations are reported.

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “UNACCEPTABLE” marked above are described immediately following the “UNACCEPTABLE” marking in the corresponding item above.

In addition, some results were detected below the laboratory reporting limit and were flagged “J” as estimated for this discrepancy. The data are acceptable for use as qualified.

DATA QUALIFIER DEFINITIONS

LABORATORY DATA QUALIFIER DEFITIONS

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the quantitation limit).

N – This flag indicates presumptive evidence of a compound and is only used for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search. This flag is used in combination with the J flag.

U - The analyte was not detected above the reporting limit. The reported result is the laboratory reporting limit.

Re: Data Review of Polychlorinated Biphenyls (PCB) Analysis
For Sediment Samples Collected on May 11-12, 2011
CLP Case No. 41260, SDG No. E0272
Duck and Otter Creeks Confluence Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2B-AOVS

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for the five percent of the sediment samples collected on May 10-12, 2011, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks Confluence Investigation Site. This data review is for PCB analyses of eleven sediment samples that includes one field duplicate sample that were collected by WESTON under Sample Delivery Group (SDG) number E0272. The samples were validated in accordance with the "Quality Assurance Project Plan (QAPP), Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, and QAPP Amendment 1 dated May 5, 2011, which includes using the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed under the U.S. EPA CLP by KAP Technologies, Inc. (KAP) located in The Woodlands, Texas, under case number 41260. There were four SDGs associated with this case number for PCB analyses. Because only five percent of data is to be validated, SDG number E0272 was selected for data validation.

Sediment samples were analyzed for PCBs using U.S. EPA CLP Statement of Work (SOW) SOM01.2. Table 2 provides a list of the PCBs that were analyzed. KAP did not provide a Staged Electronic Data Deliverable (SEDD) with the CLP analytical package. Therefore, the Automated Data Review (ADR) software was not utilized to assist in reviewing this data.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for SDG E0272. Attachment B to this report contains a printed summary report of sample results with hand-written qualifiers that were applied during the data review. Attachment C to this report contains a list of the data qualifiers associated with the sample results. The QC limits utilized were those stated in the QAPP. If

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF PCB DATA REVIEW

The initial calibration, continuing calibration, method blank, surrogates, and laboratory control sample (LCS) were within the QC limits.

The relative percent differences (RPD) calculated for the field duplicate pair were elevated. The recoveries for the matrix spike (MS) and matrix spike sample (MSD) were outside QC limits. Holding times were exceeded for all samples associated with this SDG. These issues are discussed in further detail below under Minor Problems.

Below is a review of the minor problems associated with QC failures and a summary of the data quality indicators associated with the PCB analysis for the sediment samples associated with SDG E0272.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

Field Duplicate Results. The field duplicates were collected adjacent to an investigative sample and are not of the same homogenized material. One field duplicate pair is associated with the sediment samples collected on May 11-12, 2011, and SDG E0272 (see Table 1 for which sample was designated as a field duplicate).

Because a QC limit for field duplicates was not stated in the QAPP, a default QC limit of 50 RPD was used to evaluate field duplicate results. Aroclors 1248, 1254, and 1260 were detected in the field duplicate pair. The RPDs were elevated and ranged from 71 to 81 percent. The elevated RPDs are most likely due to sample heterogeneity associated with PCBs. Table 3 summarizes the field duplicate results and RPDs.

MS and MSD Results. There is one MS and MSD associated with this SDG. The MS and MSD recoveries for Aroclor 1016 were both outside QC limits and detected high. Because Aroclor 1016 was not detected in the samples, no qualification was applied. The percent recoveries for Aroclor 1260 were within QC limits. The RPD between the MS and MSD for both Aroclors 1016 and 1260 were within QC limits.

Holding Times. The holding time limit for PCB analysis is 14 days from sample collection to extraction and 40 days from extraction to analysis. All samples in this SDG were extracted past the 14 day holding time limit. Specifically, this limit was exceeded by two to three days. The detected results were flagged "J" as estimated and the quantitation limits for non-detected results were flagged "UJ" as estimated due to holding time exceedance.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Total PCB Result Calculation. In those instances where all detected PCB results were below the reporting limit, then the laboratory did not include the detected PCB results in the total Aroclor calculation. Instead the laboratory reported the result as non-detect at the quantitation limit. During data validation, these total Aroclor results were changed to include those Aroclors detected below the reporting limit. Additionally, these total Aroclor results were flagged "J" to indicate that they are considered estimated due to being detected below the reporting limit.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The QAPP-stated reporting limits were met by the laboratory (when adjusted for percent moisture). Sensitivity was adequate for the PCB analyses of sediment samples collected on May 11-12, 2011, that are associated with SDG E0272.

Precision. Field precision is determined by evaluating the RPDs for the field duplicate results. The RPDs were elevated indicating sample heterogeneity associated with the PCB results.

Laboratory precision was evaluated by reviewing the RPD values between the MS and MSD results. There was only one MS/MSD pair associated with this SDG for which RPDs could be evaluated. The RPDs for the Aroclor 1016 and 1260 (the PCBs spiked in the MS/MSD) were 2 and 7 percent, respectively. These RPDs are within the QAPP-stated QC limits. Laboratory precision was acceptable for the PCB analysis. Table 4 summarizes the laboratory precision results.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for percent recovery for LCS and MS/MSD results. The LCS percent recoveries were within the QAPP QC limits. The MS/MSD percent recoveries were within QC limits for Aroclor 1260 but not for Aroclor 1016. Because Aroclor 1016 was not detected in the samples, data usability is not affected. Table 4 summarizes the accuracy estimates for the PCB analysis. The percent recoveries for the LCS are 112 and 121 percent for Aroclor 1016 and Aroclor 1260, respectively. The mean MS/MSD percent recoveries are 159 and 57 percent for Aroclor 1016 and Aroclor 1260, respectively. Laboratory accuracy was acceptable. The LCS Aroclor recoveries indicate a high bias associated with the PCB analysis.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

In summary, the data are usable for comparison to the PCB screening criteria stated in the QAPP. Qualifications were added to the samples during the data review for holding time exceedances. Definitions for the laboratory qualifications and data validation qualifications are included in Attachment C.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 847-918-4000.

Very truly yours,
Weston Solutions, Inc.

Lisa Graczyk

See attached.

Natalie, I qualified all results in this SDG because the samples were extracted outside holding time limits. I also changed the total Aroclor results to reflect those PCBs detected below the reporting limit. Because I didn't get an SEDD with the CLP data, you will need to manually pull qualifiers off of the summary sheets in Attachment B. Let me know if you have any questions.

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: Duck and Otter Creeks Confluence Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: August 12, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals ____	PCBs __X___	pH _____	TOC _____
Dioxins/Furans _____	PAHs _____	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other _____

2. Were the target detection limits met for each parameter?

Yes X
No _____

When adjusted for percent moisture, the QAPP stated reporting limits were met by the laboratory.

3. Were the method blanks less than the established MDL for each parameter?

Yes X
No _____ (EXPLAIN)

The method blank contained no detections of target analytes.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

There are no field replicates associated with this SDG.

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes		
No	X	(EXPLAIN)

There is one field duplicate associated with this SDG (identified with a "DP" suffix in the station location designation). The field duplicate was collected adjacent to the associated investigative sample. The field duplicate results and investigative sample results were compared to a standard QC limit of 50 RPD or less. The RPDs were elevated and ranged from 71 to 81 percent for the three Aroclors that were detected. These elevated RPDs are most likely due to sample heterogeneity associated with PCBs in these sediment samples.

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

In the MS and MSD, Aroclor 1016 was detected high, above the QC limit for percent recovery. The percent recoveries for Aroclor 1260 were within QC limits. Because Arolcor 1016 was not detected in the samples, no qualifications are warranted.

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

The LCS recoveries met the QC limits specified in the QAPP.

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Interference check samples are not applicable to PCB analyses.

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Serial dilution is not applicable to PCB analyses.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

Samples were analyzed outside the holding time requirement of 14 days to extraction. Samples were extracted 2 to 3 days past this holding time requirement. Detected sample results were flagged "J" and the quantitation limits for non-detected results were flagged "UJ" as estimated.

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Laboratory duplicates were not analyzed with the samples.

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

Dry-weight concentrations are reported.

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “UNACCEPTABLE” marked above are described immediately following the “UNACCEPTABLE” marking in the corresponding item above.

In addition, some results were detected below the laboratory reporting limit and were flagged “J” as estimated for this discrepancy. The data are acceptable for use as qualified.

DATA QUALIFIER DEFINITIONS

LABORATORY DATA QUALIFIER DEFITIONS

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the quantitation limit).

P - There is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported.

U - The analyte was not detected above the reporting limit. The reported result is the laboratory reporting limit.

DATA VALIDATION QUALIFIER DEFITIONS

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the quantitation limit).

UJ - The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Re: Data Review of Polycyclic Aromatic Hydrocarbons (PAH) Analysis
For the Pore Water of Sediment Samples Collected from May 10-12, 2011
Duck and Otter Creeks Confluence Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2B-AOVS

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for the pore water of sediment samples collected from May 10-12, 2011, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks Confluence Investigation Site. This data review is for PAH analysis of pore water of 18 sediment samples that were collected by the WESTON Superfund Technical Assessment and Response Team (START). The samples were validated in accordance with the "Quality Assurance Project Plan (QAPP), Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, and QAPP Amendment 1 dated May 5, 2011, which includes using the U.S. EPA Contract Laboratory Program National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed by Energy and Environmental Research Center (EERC) of the University of North Dakota located in Grand Forks, North Dakota. Table 2 provides a list of the PAH analytes that were tested for.

The samples were analyzed for PAHs using methodology developed by Hawthorne et al., 2005, and ASTM D7363. EERC did not provide WESTON with a staged electronic data deliverable (SEDD) and therefore, the Automated Data Review (ADR) software was not used to assist in reviewing the data. Standard quality control (QC) samples are not applicable to the methodology used for these PAH analyses including laboratory control samples, matrix spike samples, and laboratory duplicates. Therefore, a Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis was not utilized for data review. Attachment A to this report contains a summary report of results with qualifiers applied by the laboratory. Attachment B contains the data qualifier definitions. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

SUMMARY OF PAH DATA REVIEW

The blanks water samples were all non-detect for target analytes. Analyses were conducted within holding times.

The Field Sampling Plan indicated that field duplicates and field splits were not required for the PAH analyses of the pore water samples and these were not collected.

All sample results were analyzed in duplicate in accordance with the ASTM method. It is up to the data user to decide which result to use or whether to use an average of the results. In addition, the results were reported in nanogram per gram which for water samples is the same as microgram per liter because the density of water is 1 milligram per liter.

Below is a review of the data quality indicators.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The laboratory reporting limits as stated in the QAPP were not met for all PAH compounds. These reporting limits only slightly exceeded the QAPP-stated reporting limit and were below the applicable screening level stated in the QAPP for ambient water quality criteria. Therefore, data usability is not affected. The laboratory flagged some results with a "J" to indicate that the result was detected below the reporting limit and should be considered estimated. Sensitivity was adequate for the PAH analyses of the pore water of sediment samples collected from May 10-12, 2011.

Precision. Laboratory precision is typically determined by evaluating the RPD values for laboratory duplicates. Laboratory duplicates were not analyzed with the PAH analyses. However, EERC did analyze each sample in duplicate in accordance with the ASTM method. Although an RPD value was not calculated for each detected result, a review of the data indicates good correlation between the sample result duplicates. Laboratory precision is acceptable.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was not evaluated because QC samples typically analyzed to assess accuracy are not applicable to the analytical method used for the PAH analyses.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, the data are acceptable for use and some data qualifications were applied to the sample results by the laboratory for results detected below the reporting limit. The Data Summary Report in the Attachment indicates which sample results were qualified by the laboratory. Attachment B provides data qualifier definitions for those qualifiers applied by the laboratory.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 312-424-3300.

Very truly yours,
Weston Solutions, Inc.

DATA QUALIFIER DEFINITIONS

LABORATORY DATA QUALIFIER DEFITIONS

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

ND - Indicates the analyte was analyzed for but not detected.

Re: Data Review of Polynuclear Aromatic Hydrocarbon (PAH) Analysis
For Sediment Samples Collected on May 11-12, 2011
CLP Case No. 41260, SDG No. E0271
Duck and Otter Creeks Confluence Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2B-AOVS

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for the five percent of the sediment samples collected in May 2011 for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks Confluence Investigation Site. This data review is of the analysis of PAH compounds for two sediment samples that were collected by WESTON and analyzed under Sample Delivery Group (SDG) number E0271. The samples were validated in accordance with the "Quality Assurance Project Plan (QAPP), Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, and QAPP Amendment 1 dated May 5, 2011, which includes using the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed under the U.S. EPA CLP by KAP Technologies, Inc. (KAP) located in The Woodlands, Texas, under case number 41260. Because only five percent of data is to be validated, SDG number E0271 was selected for data validation.

Sediment samples were analyzed for PAHs using U.S. EPA CLP Statement of Work (SOW) SOM01.2 by gas chromatography/mass spectrometry (GC/MS) Selective Ion Monitoring (SIM) methodology. Table 2 provides a list of the PAHs that were analyzed. KAP did not provide a Staged Electronic Data Deliverable (SEDD) with the CLP analytical package. Therefore, the Automated Data Review (ADR) software was not utilized to assist in reviewing this data.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for SDG E0271. Attachment B to this

report contains a printed summary report of sample results with hand-written qualifiers that were applied during the data review. Attachment C to this report contains a list of the data qualifiers associated with the sample results. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF PAH DATA REVIEW

The initial calibration, method blank, and internal standards were within the QC limits. There were no field duplicate or field split samples associated with SDG E0271.

The matrix spike (MS) and matrix spike duplicate (MSD) results were outside QC limits for percent recoveries. One surrogate recovery was outside QC limits. A few compounds were outside QC limits in the continuing calibration verification (CCV) standards. Holding time limits for extraction were exceeded in all samples. These QC exceedances as described below under Minor Problems.

Below is a review of the minor problems associated with QC failures and a summary of the data quality indicators associated with the PAH analysis for the sediment samples in SDG E0271.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

MS and MSD Results. There was one MS/MSD pair associated with the sample for this SDG and it included two spiked compounds. The percent recoveries for acenaphthene were within QC limits. The percent recoveries for pyrene were one percent below the QC limit; however, the spike added was 4 times lower than the sample concentration making recovery of the spike difficult. No qualifications are required in this instance.

Surrogate Results. The surrogate recoveries were within the QC limits except for one surrogate in the dilution of sample E0271 (E0271DL). Because this sample was a dilution and the other surrogate was within QC limits, no qualifications were warranted.

CCV Results. The following compounds were outside QC limits of 25 percent difference in the CCV standards: benzo(b)fluoranthene (28.4 percent), benzo(e)pyrene (33.8 percent), and perylene (32.8 percent). For these three compounds, detected results were flagged “J” and the quantitation limits for non-detected results were flagged “UJ” as estimated.

Holding Times. The holding time limit for PAH analysis is 14 days from sample collection to extraction and 40 days from extraction to analysis. All samples in this SDG were extracted past the 14 day holding time limit. Specifically, this limit was exceeded by one to two days. The detected results were flagged "J" as estimated and the quantitation limits for non-detected results were flagged "UJ" as estimated due to holding time exceedance.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The CLP Contract Required Quantitation Limits (CRQL) for PAH compounds is 3.3 micrograms per kilogram (µg/kg). When adjusted for dilution factor and percent moisture, the laboratory achieved these reporting limits. Sensitivity was adequate for the PAH analyses of sediment samples collected on May 11-12, 2011, that are associated with SDG E0271.

The laboratory reported results that were below the reporting limit but above the method detection limit. These results were flagged with a "J" by the laboratory and are considered estimated results.

Precision. There were no field duplicates or splits associated with SDG E0271; therefore, field precision was not evaluated.

Laboratory precision was evaluated by reviewing the relative percent difference (RPD) values for the MS/MSD. The RPDs for the MS/MSD were 0 percent for both spiked compounds. Laboratory precision was acceptable.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy is usually evaluated by reviewing the percent recovery results for laboratory control samples and MS/MSD results. Because LCS samples are not applicable to SOM01.2 and because the MS/MSD results were unusable for one compound, laboratory accuracy could not be evaluated by theses means. However, the continuing calibration verification results were all mostly within their QC limits of less than 25 percent difference (see description under Minor Problems) which indicates that laboratory accuracy is acceptable.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, the data are usable for comparison to the PAH screening criteria stated in the QAPP. Qualifications were added to the samples during the data review due to holding time exceedances for extraction and QC limit exceedances in CCV standards for three compounds. Attachment B includes the data summary sheets that show the hand-written data qualifications applied during data validation and the laboratory data qualifications. Definitions for the validation qualifiers applied and the laboratory qualifiers are included in Attachment C.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 847-918-4000.

Very truly yours,

Weston Solutions, Inc.

See attached.

Natalie, As with the PCBs, I qualified all results in this SDG because the samples were extracted outside holding time limits. Because I didn't get an SEDD with the CLP data, you will need to manually pull qualifiers off of the summary sheets in Attachment B. Let me know if you have any questions.

CHECKLIST FOR PAH ANALYTICAL DATA FOR CASE # 41260, SDG # E0271

PAHs
BY CLP SOW SOM01.2

CASE# 41260
SDG# E0271

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: Duck and Otter Creeks Confluence Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: August 15, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals ___	PCBs _____	pH _____	TOC _____
Dioxins/Furans _____	PAHs __X___	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other _____

2. Were the target detection limits met for each parameter?

Yes X
No _____

The CLP CRQL for PAH compounds by GC/MS SIM is 3.3 micrograms per kilogram (µg/kg). When adjusted for dilution factor and percent moisture, the laboratory achieved these reporting limits.

3. Were the method blanks less than the established MDL for each parameter?

Yes X
No _____ (EXPLAIN)

The method blank contained no detections of target analytes.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

There are no field replicates associated with this SDG.

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

There are no field duplicates associated with this SDG.

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

The surrogates were within the QC limits except for one surrogate in the dilution of sample E0271 (E0271DL). Because this sample was a dilution and the other surrogate was within QC limits, no qualifications were warranted.

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

There was one MS/MSD pair associated with the sample for this SDG. The percent recoveries for acenaphthene were within QC limits. The percent recoveries for pyrene were one percent below the QC limit; however, the spike added was 4 times lower than the sample concentration making recovery of the spike difficult. No qualifications are required in this instance.

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

LCSs are not analyzed with PAH analysis by SOM01.2.

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

There were no QC limits specified in the QAPP; therefore, the QC limits specified in the CLP SOW were used for the initial calibration and continuing calibration verification (CCV) checks. The initial calibration and most continuing calibration recoveries were within QC limits. The following compounds were outside QC limits in the CCVs: benzo(b)fluoranthene, benzo(e)pyrene, and perylene. For these three compounds, detected results were flagged "J" and the quantitation limits for non-detected results were flagged "UJ" as estimated.

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes
Not Applicable
No (EXPLAIN)

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes
Not Applicable
No (EXPLAIN)

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes
Not Applicable
No (EXPLAIN)

Serial dilution is not applicable to SW-846 Method 8270C.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes
Not Applicable
No (EXPLAIN)

Trip blanks and storage blanks are not applicable to SW-846 Method 8270C.

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

Samples were analyzed outside the holding time requirement of 14 days to extraction. Samples were extracted 1 to 2 days past this holding time requirement. Detected sample results were flagged "J" and the quantitation limits for non-detected results were flagged "UJ" as estimated.

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Laboratory duplicates were not analyzed with the samples.

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

Dry-weight concentrations are reported.

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with "UNACCEPTABLE" marked above are described immediately following the "UNACCEPTABLE" marking in the corresponding item above.

In addition, some results were detected below the laboratory reporting limit and were flagged "J" as estimated for this discrepancy. The data are acceptable for use as qualified.

ATTACHMENT C

DATA QUALIFIER DEFINITIONS

LABORATORY DATA QUALIFIER DEFITIONS

D – This qualifier indicates that the sample was re-analyzed at a higher dilution factor than the original analysis.

E – The result exceeded the highest standard in the initial calibration range of the instrument. The result is an estimate.

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the quantitation limit).

U - The analyte was not detected above the reporting limit. The reported result is the laboratory reporting limit.

DATA VALIDATION DATA QUALIFIER DEFITIONS

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the quantitation limit).

UJ - The analyte was not detected at a level greater than or equal to the adjusted quantitation limit. However, the reported adjusted quantiation limit is approximate and may be inaccurate or imprecise.

Re: Data Review of Metals Analysis
For Sediment Samples Collected on May 11, 2011
CLP Case No. 41260, SDG No. ME0268
Duck and Otter Creeks Confluence Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2B-AOVS

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for the five percent of the sediment samples collected in May 2011 for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks Confluence Investigation Site. This data review is for metals analyses of seven sediment samples that include two field duplicate samples that were collected by WESTON under Sample Delivery Group (SDG) number ME0268. The samples were validated in accordance with the "Quality Assurance Project Plan (QAPP), Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, and QAPP Amendment 1 dated May 5, 2011, which includes using the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed under the U.S. EPA CLP by Sentinel, Inc., (Sentinel) located in Huntsville, Alabama, under case number 41260. Because only five percent of data is to be validated, SDG number ME0268 was selected for data validation.

Sediment samples were analyzed for metals using U.S. EPA CLP Statement of Work (SOW) ISM01.2. Table 2 provides a list of the metals that were analyzed. Sentinel did not provide a Staged Electronic Data Deliverable (SEDD) with the CLP analytical package. Therefore, the Automated Data Review (ADR) software was not utilized to assist in reviewing this data.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for SDG ME0268. Attachment B to this report contains a printed summary report of sample results with hand-written qualifiers that were applied during the data review. Attachment C to this report contains a list of the data qualifier definitions associated with the sample results. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

SUMMARY OF METALS DATA REVIEW

As stated above, only five percent of the data was validated. SDG ME0268 was selected for data validation. In SDG ME0268, the holding times, calibration standards, laboratory control sample (LCS), and interference check sample were all within the QC limits. Results were reported on a dry-weight basis.

The method blank and calibration blanks had some metals detected above the method detection limit but below the reporting limit that required some metals to be flagged as not detected in the samples. The QC limits were exceeded for some metals in the matrix spike (MS), laboratory duplicate, and serial dilution that required some metal results to be flagged as estimated. In addition, one of the two field duplicates had somewhat elevated relative percent difference (RPD) values.

Below are a description of the minor problems with QC failures and a review of the data quality indicators.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

Method Blank Results. The method blank contained minor detections of some analytes at concentrations below the reporting limit (barium, cobalt, magnesium, mercury, nickel, and potassium). Except for mercury, the detected sample results for these metals were more than 10 times the blank contamination and no qualification was required. For mercury, results detected at less than 10 times the blank result were flagged "U" as not detected below the CRQL value. Attachment B contains hand-written qualifiers indicating which sample results for mercury were flagged "U."

Calibration Blank Results. There were detections of some target analytes in the calibration blanks that were below the reporting limit but above the method detection limit. Most of the sample results were more than ten times the blank concentration and no qualifications were required. The exception were three mercury results which were flagged "U" as not detected. Attachment B contains hand-written qualifiers indicating which sample results for mercury were flagged "U."

MS Results. Three metals were detected outside the QC limit in the MS sample: antimony with a 44 percent recovery, manganese with a 71 percent recovery, and zinc with a 67 percent recovery. All antimony, manganese, and zinc results were qualified "J" as estimated due to potential matrix interference. The laboratory flagged these same results with an "N" to indicate that the MS was outside QC limits. Attachment B contains hand-written qualifiers indicating which samples were flagged "J."

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Serial Dilution Results. In the serial dilution sample, the following metals were detected at greater than the QC limit of ten percent difference: barium, beryllium, cadmium, silver, and sodium. Those sample results that are greater than 50 times the method detection limit were flagged "J" as estimated. Data usability is not affected.

Field Duplicate Results. There are two field duplicates associated with this SDG (identified with a "DP" suffix in the station location designation, see Table 1). The field duplicates were collected adjacent to one another and not from the same homogenized sample aliquot as the parent sample.

The RPDs between the field duplicate results and investigative sample results were compared to a standard QC limit of 50 RPD or less. For the field duplicate pair associated with sample OC-42-02, all RPDs were below 50 except for one analyte which had an RPD of 80. In general there was good correlation between the parent sample and field duplicate sample OC-42-02DP. Table 3 summarizes the field duplicate results.

For the field duplicate pair associated with sample OC-25-01, more than half of the RPDs exceeded 50 percent. The elevated RPDs indicate definite sample heterogeneity associated with sample OC-25-01 and its duplicate. Table 3 summarizes the field duplicate results.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the attachments.

Sensitivity. The laboratory reporting limits stated in the QAPP were met for target metals, when adjusted for percent moisture. The laboratory reported those results detected below the reporting limit and flagged these results with a "J" as estimated. Sensitivity was acceptable for the samples associated with SDG ME0268.

Precision. Field precision was evaluated by evaluating the RPDs for two field duplicate samples. Although one RPD values for some sample were somewhat high, the average RPD value for the two field duplicates were acceptable, with one high average lead RPD value of 88 percent. This does not affect data usability and in general the field duplicate results had good correlation to the parent sample results. The mean RPDs ranged from 7 to 88 percent. Field precision was evaluated and found to be acceptable. Table 4 summarizes the field precision results.

Laboratory precision was determined by evaluating the RPD values for the laboratory duplicate. The RPD values for the laboratory duplicates were within the QC limits except for zinc. Zinc

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

results were qualified based on this and data usability is not affected based on one elevated RPD value. Laboratory precision was adequate for the metals analysis. Table 4 summarizes the laboratory precision RPDs.

Accuracy. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for percent recovery for the LCS and MS results. There were three MS recoveries outside QC limits (only two required qualification, see Minor Problems Section). The LCS recoveries were within QC limits. The LCS recoveries ranged from 95 to 124 percent and the MS recoveries ranged from 44 to 119 percent. Laboratory accuracy was acceptable. Table 4 summarizes the accuracy estimates for this project. In general, there appears to be a slightly high bias associated with the metals analyses for SDG ME0268.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All sample results were received.

In summary, the data are acceptable for use and data qualifications were applied to the sample results for method blank contamination, calibration blank contamination, MS results, and serial dilution results. The data summary sheets in Attachment B contain hand-written qualifiers to indicate which samples were qualified during data validation. The laboratory data qualifiers applied are also indicated on the data summary sheets in Attachment B. Attachment C provides data qualifier definitions for those qualifiers applied during data validation and by the laboratory.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 312-424-3300.

Very truly yours,
Weston Solutions, Inc.

See Attached.

Natalie, there were no SEDDs for the CLP Data for Duck and Otter. Therefore, you will need to manually enter in my qualifiers from Att B. Note that I'm only reviewing 5 percent of data so you won't see all sample results for CLP metals in the attachment.

QA/QC ANALYSIS CHECKLIST FOR METALS FOR SDG ME0268

Metals
BY CLP SOW ISM01.2

CASE# 41260
SDG# ME0268

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: Duck and Otter Creeks 2010 Data Gaps Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: July 29, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals _X_	PCBs _____	pH _____	TOC _____
Dioxins/Furans _____	PAHs _____	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other _____

2. Were the target detection limits met for each parameter?

Yes X
No _____ (EXPLAIN)

The laboratory reporting limits were met (prior to adjustment for percent moisture).

3. Were the method blanks less than the established MDL for each parameter?

Yes _____
No X (EXPLAIN)

The method blank contained minor detections of some analytes at concentrations below the reporting limit (barium, cobalt, magnesium, mercury, nickel, and potassium). Except for mercury, the detected sample results for these metals were more than 10 times the blank contamination and no qualification was required. For mercury, results detected at less than 10 times the blank result were flagged "U" as not detected below the CRQL value.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes		
No	X	(EXPLAIN)

There are two field duplicates associated with this SDG (identified with a "DP" suffix in the station location designation). The field duplicates were collected adjacent to one another and not from the same homogenized sample aliquot as the parent sample.

The RPDs between the field duplicate results and investigative sample results were compared to a standard QC limit of 50 RPD or less. For the field duplicate pair associated with sample OC-42-02, all RPDs were below 50 except for one analyte which had an RPD of 88. For the field duplicate pair associated with sample OC-25-01, more than half of the RPDs exceeded 50 percent. The elevated RPDs indicate sample heterogeneity.

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes	
No	X

Three metals were detected outside the QC limit in the MS sample: antimony had a 44 percent recovery, manganese had a 71 percent recovery, and zinc had a 67 percent recovery. All antimony, manganese, and zinc results were qualified "J" as estimated due to potential matrix interference. The laboratory flagged these same results with an "N" to indicate that the MS was outside QC limits.

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

An MSD was not analyzed with the dissolved metals analysis.

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

Metals Checklist (CLP Data)
Duck and Otter Creeks 2010 Data Gaps Investigation
ALS Laboratory Group
Case #: 41260, SDG #: ME0268

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

There were detections of several target analytes in the calibration blanks that were below the reporting limit but above the method detection limit. Most of the sample results were more than ten times the blank concentration and no qualifications were required. The exception was three mercury results which were flagged "U" as not detected.

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

The following metals were detected at greater than a ten percent difference in the serial dilution sample: barium, beryllium, cadmium, silver, and sodium. Those sample results that are greater than 50 times the method detection limit were flagged "J" as estimated. Data usability is not affected.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

Trip blanks and storage blanks are not applicable to this work order.

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes		
No	X	(EXPLAIN)

The laboratory duplicate met the requirements of the data validaton guidance of less than 20 RPD except for zinc. Detected results for zinc were flagged "J" as estimated.

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with "UNACCEPTABLE" marked above are described immediately following the "UNACCEPTABLE" marking in the corresponding item above.

The data are acceptable for use as qualified.

DATA QUALIFIER DEFINITIONS

LABORATORY DATA QUALIFIER DEFITIONS

* - Duplicate analysis not within control limits.

D - The reported value is from a dilution.

E - The reported value is estimated due to the presence of interference.

J - The result is an estimated value that was detected outside the quantitation range.

N - Spiked sample recovery not within control limits.

U - The analyte was analyzed for, but not detected at or above the reporting limit.

DATA VALIDATION DATA QUALIFIER DEFITIONS

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due to the quality of the data generated because certain quality control criteria were not met).

U - The analyte was analyzed for, but not detected above the level of the reported sample quantitation limit.

Re: Data Review of General Chemistry Analyses (DOC, hardness, pH, and ammonia)
For the Pore Water of Sediment Samples Collected on May 10-12, 2011
Duck and Otter Creeks Confluence Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2B-AOVS

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for sediment samples collected on May 10-12, 2011, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks Confluence Investigation (Duck and Otter) Site. This data review is for dissolved organic carbon (DOC), hardness, pH, and ammonia analyses of the pore water of 21 sediment samples that includes two field split and two field duplicate samples that were collected by the WESTON Superfund Technical Assessment and Response Team (START). The samples were validated in accordance with the "Quality Assurance Project Plan (QAPP), Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, and QAPP Amendment 1 dated May 5, 2011, which includes using the U.S. EPA Contract Laboratory Program National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed by Columbia Analytical Services (CAS) located in Kelso, Washington, under the following three work orders:

- K1104187
- K1104250
- K1104355

Pore water was extracted from the sediment samples and then the pore water was analyzed for DOC using U.S. EPA Method 415.1; for hardness (as calcium carbonate) using Standard Method (SM) 2340B and U.S. EPA SW-856 Method 6010C; for pH using SM 4500-H+B; and for ammonia (as nitrogen) using SM 4500-NH3E. CAS provided WESTON with a staged electronic data deliverable (SEDD) that was used in conjunction with the Automated Data Review (ADR) software to assist in reviewing the data. All SEDDs were imported into the ADR software for review by the software program and all data was checked for completeness. Five percent of the data was put through a full data validation. Therefore, one of the work orders, K1104187, was

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

selected for the full data validation. Work order K1104187 contained two sediment samples general chemistry parameters of pore water.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for work order K1104187. Attachment B to this report contains a printed report from ADR that provides a summary of results with qualifiers applied by the laboratory and the ADR program. Attachment C contains the data qualifier definitions. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF GENERAL CHEMISTRY DATA REVIEW

As stated above, five percent of the data was fully validated. Work order K1104187 was selected for full data validation. In work order K1104187, calibration standards, laboratory control samples (LCS), laboratory duplicates, matrix spike (MS) samples, matrix spike duplicates (MSD), interference check sample, and holding times were all within the QC limits as applicable to each method for DOC, pH, ammonia, and hardness.

Through full data validation and the ADR program, two problems with the quality control indicators were discovered. For the pH analyses, the holding time limits were excessive for some samples. In addition, there was minor contamination below the reporting limit in the method blank for DOC and ammonia; however, no qualification was required because the sample results were much greater.

In accordance with the Field Sampling Plan, field duplicates and field splits were not to be collected for the pore water analyses; however, two field split and two field duplicate samples were collected. A QC limit for field duplicates was not stated in the QAPP; therefore, a default QC limit of 50 relative percent difference (RPD) was used to evaluate field split and duplicate results. The RPDs for hardness and pH were all below 50 percent. The RPD for ammonia was elevated in one field duplicate sample and the RPDs for DOC were elevated in one field duplicate and one field split sample. This indicates some minor heterogeneity with ammonia and DOC in the pore water samples. Field duplicate and field split results are acceptable. Tables 2 and 3 summarize the field split and field duplicate results, respectively.

Below are a description of the minor problems with QC failures and a review of the data quality indicators.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

Holding Times. The holding times for DOC, ammonia, and hardness were acceptable. For pH, the method states that samples should be analyzed as soon as possible. Approximately 13 pore water sample pH results were flagged "J" as estimated because the pH analysis was conducted more than 14 days after sediment collection.

Method Blanks and Calibration Blanks. Ammonia and DOC were detected in method blanks and calibration blanks above the method detection limit but below the reporting limit. Sample results were much greater than the method blank concentration and therefore, no qualifications were required.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The laboratory reporting limits as stated in the QAPP was met for all samples when adjusted for the dilution factors. Sensitivity was acceptable.

Precision. Field precision was evaluated by evaluating the RPDs for the two field split and two field duplicate samples. There were two elevated RPDs for DOC and one elevated RPD for ammonia indicating some minor sample heterogeneity associated with ammonia and DOC. However, the average RPDs for all splits/duplicates were less than 50 percent. Tables 2 and 3 summarize the field split and field duplicate results, respectively. Field precision was evaluated and found to be acceptable.

Laboratory precision was determined by evaluating the RPD values for the laboratory duplicates for DOC, pH, hardness, and ammonia. The RPD values were all within the QAPP-stated QC limits. The mean RPDs for laboratory duplicates ranged from 0 to 2 percent. Table 4 summarizes the laboratory precision results. The laboratory precision was acceptable for the DOC, pH, ammonia, and hardness analyses.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for percent recovery for MS results for DOC and ammonia; and LCS results for DOC, hardness, pH, and ammonia.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

The mean LCS recoveries ranged from 98 to 100 percent and are within the QAPP QC limits. The mean MS recoveries ranged from 105 to 108 percent and are within the QAPP specified QC limits. Laboratory accuracy is acceptable. The LCS recoveries do not indicate a bias associated with the pH, ammonia, hardness, and DOC results.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, the data are acceptable for use and data qualifications were applied to some sample result for excessive holding times for pH. The ADR Summary Report in Attachment B indicates which sample results were flagged during data validation and the reason for the qualification. The laboratory data qualifiers applied are also indicated on the ADR Summary Report in Attachment B. Attachment C provides data qualifier definitions for those qualifiers applied during data validation (no qualifications were applied by the laboratory).

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 312-424-3300.

Very truly yours,
Weston Solutions, Inc.

TABLE 4
QUANTITATIVE DATA ASSESSMENT

Analyte	Analytical Precision	Analytical Accuracy/Bias	
	Mean Laboratory Duplicate or LCS/LCSD RPD (%) (n=4 for DOC, Ammonia; n=3 for pH; n=1 for Hardness)	Mean MS Recovery (%) (n=3 for DOC; n=1 for Ammonia)	Mean LCS Recovery (%) (n=5 for DOC, pH; n=6 for Ammonia; n=3 for Hardness)
DOC	1	105	99
Hardness	2	NA	90/100*
pH	0	NA	99
Ammonia	2	108	98

Notes:
* For hardness, a result is calculated from the results for calcium and magnesium. Therefore, the values listed for mean LCS are for calcium/magnesium.

DOC – Dissolved Organic Carbon
LCS – Laboratory Control Sample
MS – Matrix Spike
NA – Not Applicable
RPD – Relative Percent Difference

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

ATTACHMENT A

QA/QC ANALYSIS CHECKLIST FOR GENERAL CHEMISTRY PARAMETERS
FOR WORK ORDER K1104187

GENERAL CHEMISTRY PARAMETERS

Dissolved Organic Carbon (DOC) by U.S. EPA Method 415.1
Hardness (as calcium carbonate) by SM 2340B and SW-846 6010C
pH by SM 4500-H+B
Ammonia (as nitrogen) by SM 4500-NH3E

WORK ORDER # K1104187

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: GLNPO Duck and Otter 2010 Data Gaps Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: August 8, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals _____	PCBs _____	pH ___X__	TOC _____
Dioxins/Furans _____	PAHs _____	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other ___X (DOC, ammonia, and hardness)

2. Were the target detection limits met for each parameter?

Yes X
No _____ (EXPLAIN)

The reporting limits as stated in the QAPP were achieved when adjusted for dilution factors.

3. Were the method blanks less than the established MDL for each parameter?

Yes _____
No X (EXPLAIN)

A method blank was analyzed with the DOC, ammonia, and hardness analyses.

For the ammonia and DOC analyses, ammonia and DOC were detected below the reporting limit but above the method detection limit in the method blank. Specifically, DOC was detected at 0.09 mg/L and ammonia was detected at 0.033 mg/L. Because the sample results were above the reporting limit and significantly above the method blank results, no qualifications are required.

General Chemistry Parameters Checklist
GLNPO Duck and Otter Creeks Confluence Investigation
Columbia Analytical Services
Laboratory Work Order #: K1104187

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Internal standards and surrogates are not applicable to the pH, ammonia, hardness, and DOC analyses.

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

An MS was analyzed with the DOC and ammonia analyses.

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

.

General Chemistry Parameters Checklist
GLNPO Duck and Otter Creeks Confluence Investigation
Columbia Analytical Services
Laboratory Work Order #: K1104187

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

.

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

There were minor detections of ammonia and DOC in the calibration blanks below the reporting limit. The sample concentrations were much greater and no qualifications were required.

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

Interference check sample results are applicable to hardness analysis only.

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Serial dilution results were not analyzed with the analyses.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	X	
No		(EXPLAIN)

17. Are measured dry-weight contaminant concentrations reported?

Yes	Not Applicable	
No		(EXPLAIN)

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “UNACCEPTABLE” marked above are described immediately following the “UNACCEPTABLE” marking in the corresponding item above.

The data are acceptable for use.

Re: Data Review of Total Petroleum Hydrocarbons (TPH) as Gasoline Range Organics (GRO), Diesel Range Organics (DRO), and Residual Range Organics (RRO) Analysis
For Sediment Samples Collected on May 10-12, 2011
Duck and Otter Creeks Confluence Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2B-AOVS

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for sediment samples collected on May 10-12, 2011, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks Confluence Investigation (Duck and Otter) Site. This data review is for TPH as GRO, DRO, and RRO analyses of 53 sediment samples that include four field splits and four field duplicates that were collected by the WESTON Superfund Technical Assessment and Response Team (START). The samples were validated in accordance with the "Quality Assurance Project Plan (QAPP), Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, and QAPP Amendment 1 dated May 5, 2011, which includes using the U.S. EPA Contract Laboratory Program National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed by Columbia Analytical Services (CAS) located in Kelso, Washington, under the following three work orders:

- K1104187
- K1104250
- K1104355

The samples were analyzed for TPH using U.S. EPA SW-846 Method 8015C. CAS provided WESTON with a staged electronic data deliverable (SEDD) that was used in conjunction with the Automated Data Review (ADR) software to assist in reviewing the data. All SEDDs were imported into the ADR software for review by the software program and all data was checked for completeness. Five percent of the data was put through a full data validation. Therefore, one of

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

the work orders, K1104187, was selected for the full data validation. Work order K1104187 contains seven sediment samples, including one field split, for TPH analysis.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for work order K1104187. Attachment B to this report contains a printed report from ADR that provides a summary of results with qualifiers applied by the laboratory and the ADR program. Attachment C contains the data qualifier definitions. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF TPH DATA REVIEW

As stated above, five percent of the data was fully validated. Work order K1104187 was selected for full data validation. In work order K1104187, the holding times, calibration standards, laboratory control samples (LCS), field splits, matrix spike (MS), and matrix spike duplicates (MSD) were all within the QC limits. For the remaining work orders, the ADR program indicated that all holding time limits and LCS recoveries were within QC limits. All sample results were based on a dry weight for the TPH analyses.

Through full data validation and the ADR program, some minor problems with the quality control indicators were discovered. There were minor detections of target analtyes in the method blanks requiring some GRO results to be flagged as not detected. In two MS/MSD samples, the percent recoveries were outside the QC limits. In addition, some surrogates were outside QC limits requiring some results to be flagged as estimated. See discussion under Minor Problems for further details.

The QAPP stated that field splits (replicates) and field duplicate samples would be collected at a 5 percent frequency. There were a total of 45 field investigative samples and four field duplicates and four field splits collected (see Table 1 for which samples are designated as field duplicates and splits). Therefore, the QAPP-stated frequency was met for the field duplicates and splits. A QC limit for field splits and field duplicates was not stated in the QAPP; therefore, a default QC limit of 50 relative percent difference (RPD) was used to evaluate field split and duplicate results. The RPDs for all the field splits and three of the field duplicates are below 50 RPD. For one field duplicate, OC-42-02-DP, the RPDs were elevated indicating sample heterogeneity associated with this one sample. No qualifications are applied based on field duplicate results. Tables 2 and 3 summarize the field split and field duplicate results, respectively.

Below are a description of the minor problems with QC failures and a review of the data quality indicators.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

Method Blanks. There were minor detections of RRO and GRO in the method blanks below the reporting limit and above the method detection limit. In some samples the GRO result was less than five times the method blank result and below the reporting limit. These GRO results were flagged "U" as not detected. No RRO results required qualification based on method blank results.

MS and MSDs. There were a total of four MS/MSD pairs associated with the DRO, RRO, and GRO analyses. All percent recoveries for MS/MSDs were within QC limits except for RRO for two MS/MSD pairs and DRO for one MS/MSD pairs. In these instances, no qualifications were required because the sample concentrations were more than four times the amount of the spike added making the spike recovery difficult.

Surrogate Results. Several samples had surrogate recoveries outside of the QC limits. In some of these instances there were high concentrations of target analytes in the samples and dilutions were required by the laboratories. No qualification was required because of the dilutions affecting surrogate recovery.

In other instances, the surrogate recoveries were outside QC limits and dilutions were not required. In these instances, there was typically a high concentration of the target anaytle in the sample and the poor surrogate recovery may be due to matrix interference (the high analyte concentration interfering with the surrogate recovery). In these instances, the compound result that was related to the surrogate outside QC limits was flagged "J" as estimated. The ADR Summary Report in Attachment B shows which TPH results were flagged "J" based on surrogate spike results.

Target Compound Identification. Target compound identification followed the method and was acceptable; however, the chromatograms for the petroleum product identified in the samples were not exact matches to the chromatograms for the DRO, RRO, and GRO standards used. CAS qualified most sample results to provide further details regarding the chromatograms. The qualifiers used were "O" and "Y" and are defined as follows:

- An "O" qualifier indicates that the chromatographic fingerprint resembles an oil product, but does not match the calibration standard.
- A "Y" qualifier indicates that the chromatographic fingerprint resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The laboratory reporting limits stated in the QAPP were 25 milligrams per kilogram (mg/kg) for DRO, 100 mg/kg for RRO, and 25 mg/kg for GRO. When corrected for dilutions and percent moisture, these reporting limits were met. In addition, the laboratory reported results detected below the reporting limit and above the method detection limit (all sample results reported below the reporting limit were qualified "J" as estimated). Sensitivity was adequate for the DRO, RRO, and GRO analyses of sediment samples collected on May 10-12, 2011.

Precision. Field precision was determined by evaluating the RPDs for the field split and field duplicate results. The mean RPDs for field splits ranged from 5 to 8 percent and the mean RPDs for field duplicates ranged from 32 to 45 percent. Field precision was evaluated and found to be acceptable. Table 4 summarizes the mean field split and duplicate RPDs for each analyte.

Laboratory precision was determined by evaluating the RPD values between MS and MSD results. The mean MS/MSD RPD values were within QC limits. The mean RPD values ranged from 4 to85 percent. Laboratory precision was acceptable. Table 4 summarizes the mean RPDs for MS/MSDs.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for percent recovery for LCS and MS/MSD results. All LCS and MS/MSD mean percent recoveries were within the QAPP QC limits. Table 4 summarizes the accuracy estimates for the TPH analyses. The mean recoveries for LCSs ranged from 92 to 96 percent and the mean recoveries for MS/MSDs ranged from 81 to 110 percent. Laboratory accuracy was acceptable. The mean LCS recoveries indicate a slightly low bias associated with the TPH analysis.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, there were some minor problems with QC failures as discussed above that required some results to be flagged. The ADR Summary Report in Attachment B indicates which sample results were flagged during data validation and the reason for the qualification. The laboratory data qualifiers applied are also indicated on the ADR Summary Report in Attachment B. Attachment C provides data qualifier definitions for those qualifiers applied during data validation and by the laboratory.

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: Duck and Otter Creeks Confluence Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: August 5, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals ____	PCBs _____	pH _____	TOC _____
Dioxins/Furans _____	PAHs _____	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other __X (TPH)

2. Were the target detection limits met for each parameter?

Yes X
No _____ (EXPLAIN)

When corrected for percent moisture and dilutions, the reporting limits as stated in the QAPP were met.

3. Were the method blanks less than the established MDL for each parameter?

Yes _____
No X (EXPLAIN)

The method blank contained RRO at 8.1 mg/kg and GRO at 1.7 mg/kg which are below the reporting limit and greater than the method detection limit. One sample result, OC-34-01, was detected below the reporting limit and had a similar concentration as the GRO blank result. The GRO result in sample OC-34-01 was flagged "U" as not detected.

TPH Checklist
Duck and Otter Creeks Confluence Investigation
Columbia Analytical Services
Laboratory Work Order #: K1104187

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes	X	
No		(EXPLAIN)

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

In some samples, the surrogates were detected outside the QC limits. The affected sample results that were not due to sample dilutions were flagged "J" as estimated.

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

TPH Checklist
Duck and Otter Creeks Confluence Investigation
Columbia Analytical Services
Laboratory Work Order #: K1104187

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

18. Please provide details for all of the "EXPLAIN" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “EXPLAIN” marked above are described immediately following the “EXPLAIN” marking in the corresponding item above.

Note that the laboratory qualified many of the sample results with a “J”, “O”, “Y”, and “D” are defined as follows:

- A “J” qualifier indicates that the sample result should be considered estimated because it was detected below the reporting limit.
- An “O” qualifier indicates that the chromatographic fingerprint resembles an oil product, but does not match the calibration standard.
- A “Y” qualifier indicates that the chromatographic fingerprint resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- A “D” qualifier indicates that the reported result is from a dilution.

TPH Checklist
Duck and Otter Creeks Confluence Investigation
Columbia Analytical Services
Laboratory Work Order #: K1104187

All of these results should be considered estimated. Note that the sample chromatographic patterns not matching up to the standards is to be expected because of the weathering/degrading of the petroleum products over time.

The data are acceptable for use as qualified.

ATTACHMENT C

DATA QUALIFIER DEFINITIONS

LABORATORY DATA QUALIFIER DEFITIONS

D - The reported result is from a dilution.

J - The result is an estimated value that was detected outside the quantitation range.

O - Indicates that the chromatographic fingerprint resembles an oil product, but does not match the calibration standard.

U - The analyte was analyzed for but not detected at or above the method detection limit and/or reporting limit

Y - Indicates that the chromatographic fingerprint resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.

DATA VALIDATION DATA QUALIFIER DEFITIONS

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the quantitation limit).

U - The analyte was analyzed for but not detected at a level equal to or greater than the reporting limit.

UJ - The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

EXECUTIVE SUMMARY

Weston Solutions, Inc. (WESTON®) has prepared this Sediment Assessment Report to summarize site characterization activities conducted for the Lower Maumee River project area in Toledo, Lucas County, Ohio as part of the Maumee River Area of Concern (AOC) United States Environmental Protection Agency (U.S. EPA) Great Lakes National Program Office (GLNPO) Great Lakes Legacy Act (GLLA) Project. The purpose of the GLLA project is to further define chemical contaminants in sediment, locate contaminated areas for additional evaluation, delineate hotspots, and attempt to identify any ongoing sources. The objective of this site characterization was to collect samples for chemical and physical properties analysis needed to support project area assessment and potential remediation activities.

When the Maumee River AOC was designated, it was primarily due to the large problem of agricultural runoff. However, upon further investigation, more problems were discovered, including former dumps and contaminated industrial sites, combined sewer overflows (CSO), and disposal of dredged materials. The biological communities in the Lower Maumee River have been identified as impaired. The land surrounding the Lower Maumee River project area is primarily industrial and commercial, with both current and historical sources of contamination. These sources of contaminants include various industries, chemical plants, petroleum production, and wastewater outfalls. The "Maumee Area of Concern Stage 2 Watershed Restoration Plan" dated 2006 indicated elevated concentrations of polychlorinated biphenyls (PCB), polycyclic aromatic hydrocarbons (PAH), and heavy metals in surface sediment in the Lower Maumee River project area.

The Lower Maumee River project area extends 5 river miles and is bound on the downstream edge by the Interstate 280 bridge (Veterans' Glass City Skyway) and on the upstream edge just downstream of Walbridge Park in Toledo, Ohio. During the site characterization, a total of 337 sediment samples (including 303 investigative, 17 field split, and 17 duplicate samples) were collected from 84 sampling locations in the Lower Maumee River project area. The sample design was based on detecting "hot spots" (local areas of elevated concentration) with a 646-foot-radius and a 95% confidence probability.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Where sediment recovery was adequate, samples typically were collected from the following intervals: 0 to 6, 6 to 24, 24 to 48, 48 to 72, 72 to 96, 96 to 120, 120 to 144, and 144 to 168 inches below sediment surface (bss). Sediment volume was not expected to be adequate to allow collection of a sediment core at sampling locations near the center of the river upstream of Interstate 75. Therefore, only a surface sample from 0 to 6 inches bss was planned for collection using a ponar device at these locations. However, during site characterization activities, adequate core recovery was unexpectedly achieved at several locations near the center of the river upstream of Interstate 75. Samples were collected using a ponar device at many of these locations, and then the sampling team returned to several locations to collect a sediment core on a later date. Sediment cores were collected to depth of refusal or until native material was encountered. Sediment cores typically were collected using the GLNPO research vessel (R/V) Mudpuppy II. However, due to equipment problems with the Mudpuppy II, some sediment samples were collected using a vibracore device mounted to a pontoon boat.

All sediment samples were analyzed for the contaminants of potential concern (COPC): Target Analyte List (TAL) metals (including mercury) and semivolatile organic compounds (SVOC). In addition, approximately 10 percent (%) of all sediment samples collected were analyzed for Target Compound List (TCL) pesticides and PCB Aroclors. All sediment samples also were analyzed for physical properties, including % moisture, total organic carbon (TOC), and grain size.

The sample results for SVOCs, metals, PCBs, and pesticides were compared to Probable Effect Concentrations (PEC) set forth in the document "Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems" (by D.D. MacDonald, et. al., dated 2000). The metals results were also compared to Ohio-specific Sediment Reference Values (SRV) set forth in the "Ohio Ecological Risk Assessment Guidance Document" dated February 2003, revised April 2008. Ecological Screening Levels (ESL) for sediment as set forth in U.S. EPA Region 5's "Ecological Screening Levels" dated 2003 were presented as a secondary source of screening criteria for SVOCs, metals, PCBs, and pesticides that do not have a developed PEC.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

The PECs and ESLs provide screening criteria to evaluate sediment chemistry data. PECs are defined as concentrations above which adverse effects are expected to occur and are the primary screening criteria for this characterization project. The ESLs represent a protective benchmark (for example, water quality criteria, sediment quality guidelines and criteria, and chronic no adverse effect levels) and are the secondary screening criteria. The Ohio-specific SRVs were developed to identify representative background sediment concentrations for lotic (flowing) water bodies.

The paragraphs below summarize the comparison of the analytical data to the screening levels, when available, for SVOCs, TAL metals, PCBs, and TCL pesticides.

SVOCs

Total PAH 17 and several individual PAHs (anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene) were detected at concentrations exceeding PECs.

Anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, phenanthrene, and pyrene exceeded their respective PECs in the sample collected from location LMR11-14 from 0 to 6 inches bss. The calculated total PAH 17 concentration for sample LMR11-14-006 was 92,474.2 micrograms per kilogram (µg/kg), which exceeds the total PAH PEC of 22,800 µg/kg. LMR11-14 is near Corbutt Island in the upstream portion of the project area. Concentrations of PAHs exceeding PECs were detected only in the upper 6 inches of sediment at LMR11-14, which may be attributable to sediment deposited from upstream areas. The downstream side of Corbutt Island, where LMR11-14 is located, is a depositional zone for sediments. Sediment samples collected from deeper intervals at LMR11-14 did not contain PAHs at concentrations exceeding PECs. The 0 to 6 inch bss sample at LMR11-14 consisted primarily of sand (greater than 75%) whereas deeper samples at LMR11-14 consisted of higher percentages of silt and clay.

Anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene exceeded their respective PECs in the sample collected from LMR11-

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

69 from 0 to 6 inches bss. The calculated total PAH 17 concentration for sample LMR11-69-006 was 297,600 µg/kg, which exceeds the total PAH PEC of 22,800 µg/kg. Sediment recovery was poor at location LMR11-69 so deeper samples were not collected from this location. Therefore, the vertical extent of PAHs at concentrations exceeding the PECs is not defined. LMR11-69 was located near the mouth where Swan Creek discharges into the Maumee River. Elevated concentrations of PAHs have been detected in Swan Creek. The 0 to 6 inch bss sample at LMR11-69 consisted primarily of sand (greater than 75%).

Naphthalene and phenanthrene were detected at concentrations exceeding their PECs at sample location LMR11-50 at a depth of 72 to 96 inches bss. LMR11-50 was located near a CSO, which may be the source of PAHs detected in this area of the river.

TAL METALS

Metals exceeding PECs were noted throughout the investigation area, mostly in samples collected closer to the shores. The following TAL metals were detected at concentrations exceeding their respective PECs in at least one sample: arsenic, cadmium, chromium, lead, mercury, and zinc. The maximum concentration of lead in sediment, 419 milligrams per kilogram (mg/kg), was detected in a sample collected from location LMR11-69 from 0 to 6 inches bss. Elevated concentrations of PAHs also were detected in this sample which is located near the mouth of Swan Creek. High concentrations of lead also were detected in samples collected from LMR11-63 and LMR11-64 near the Clayton Street/Woodville Road bridge (Anthony Wayne High Level Bridge).

The maximum concentration of mercury in sediment, 5.6 mg/kg, was detected in a sample collected from LMR11-72 from 0 to 6 inches bss. A petroleum odor and a blue sheen on the water were noticed as the core at LMR11-72 was recovered. Sampling location LMR11-72 was placed at a historic sampling location previously identified as MAUMEE R AT PORTSIDE DOCKS, where elevated metals concentrations have been detected.

Sample location LMR11-72 is directly downstream from sample location LMR11-69 which also showed elevated concentrations of metals.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

PCBs

PCBs were not identified as a contaminant of concern for this site. While a subset of sediment samples were analyzed for PCBs, they were not detected in any sediment samples collected during site characterization activities.

TCL PESTICIDES

Detected concentrations of pesticides did not exceed their respective PECs in any samples collected during site characterization activities.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

1. INTRODUCTION

Weston Solutions, Inc. (WESTON®), has prepared this Sediment Assessment Report to summarize site characterization activities conducted for the Lower Maumee River project area in Toledo, Lucas County, Ohio (**Figure 1-1**). WESTON prepared the Sediment Assessment Report in response to a request from the United States Environmental Protection Agency (U.S. EPA) Great Lakes National Program Office (GLNPO) under Superfund Technical Assessment and Response Team (START) III Contract No. EP-S5-06-04, Technical Direction Document (TDD) No. S05-0008-1103-006. The site characterization activities were conducted as part of the Maumee River Area of Concern (AOC) Great Lakes Legacy Act (GLLA) project. The purpose of the GLLA project is to define chemical contaminants in sediment, locate contaminated areas for additional evaluation, delineate hotspots, and attempt to identify any ongoing sources. The data collection activities were conducted in accordance with WESTON's approved Quality Assurance Project Plan (QAPP) dated July 2011.

The sections below discuss the report organization, site description, site background and history, possible sources of contamination, the purpose of the study and project objectives, and contaminants of potential concern (COPC) and target analytes.

1.1 REPORT ORGANIZATION

This Sediment Assessment Report is organized as follows:

- Section 1 – Introduction
- Section 2 – Site Characterization Activities
- Section 3 – Sample Analytical Results
- Section 4 – Data Completeness
- Section 5 – Summary

Tables and figures are included after Section 5. **Appendix A** provides the sediment core logs, **Appendix B** provides analytical data tables for all samples collected, and **Appendix C** provides a photographic log of site conditions and sampling activities.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

1.2 SITE DESCRIPTION

The "Maumee Area of Concern Stage 2 Watershed Restoration Plan" states that the Maumee River begins in Fort Wayne at the confluence of the St. Joseph and St. Mary's Rivers and flows through Defiance and Napoleon and then on toward Toledo. Two major tributaries join the Maumee River: the Tiffin and Auglaize Rivers. In Wood and Lucas Counties, several smaller streams flow into the Maumee River: Beaver and Tontogany Creeks from the south and Swan Creek, which join the Maumee River in downtown Toledo.

The Maumee River travels more than 130 river miles to Lake Erie, 108 miles of which are located in Ohio. The Maumee River AOC does not include the entire Maumee River watershed. Instead, it includes the river's lower reach and tributaries as well as some neighboring watersheds (**Figure 1-1**). The boundaries of the Maumee River AOC originally were identified as the area extending from the Bowling Green water intake near Waterville (River Mile 22.8) along the Lower Maumee River downstream to Maumee Bay. The area includes direct drainage into the waters that are within Lucas, Ottawa, and Wood Counties and includes Swan Creek, Ottawa River (Tenmile Creek), Duck Creek, Otter Creek, Grassy Creek, Cedar Creek, and Crane Creek. In 1992, the AOC was expanded to include Packer Creek, Turtle Creek, Rusha Creek, and the Toussaint River. In 2010, the AOC boundaries were formally realigned to match the associated hydrologic units (**Figure 1-1**). The AOC's drainage area covers nearly all of Lucas County and parts of Fulton, Wood, Ottawa, and Sandusky Counties. The Maumee River AOC covers 787 square miles. The Maumee River has the largest drainage area of any Great Lakes river, with 3,942 stream miles.

The Lower Maumee River project area is located in the Maumee River AOC in Toledo, Lucas County, Ohio. The investigation area extends 5 river miles and is bound on the downstream edge by the Interstate 280 bridge (Veterans' Glass City Skyway) and on the upstream edge just downstream of Walbridge Park in Toledo, Ohio (**Figure 1-2**). The Ohio Environmental Protection Agency's (Ohio EPA) "Maumee Remedial Action Plan (RAP) Stage 1 Investigation Report" dated 1990 identified 10 beneficial use impairments (BUI) for the Maumee River AOC that also apply to the Lower Maumee River project area.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

The Maumee River subsurface consists of layers of bedrock with overlying layers of gravel, sand, silt, and clay left behind by glaciers and glacial lakes. Most regional bedrock is dolomite, a magnesium-bearing form of limestone. Smaller areas of sandstone and shale are present, especially in northwestern Lucas County.

The soils of the Maumee River are level to gently sloping and are very poorly to somewhat poorly drained. Lucas County formed in clayey and loamy, lake-laid sediment and water-reworked glacial till on broad flats of an old glacial lake.

The land area, or the watershed, that the Maumee River drains is 6,586 square miles, of which about 85 percent (%) is agricultural land. Daily average discharge ranges from a high of 94,000 cubic feet per second (cfs) to a low of 32 cfs and contributes about 25% of the total tributary discharge into Lake Erie exclusive of the Detroit River. The average annual rainfall in the river basin is 34.5 inches. The area in Wood and Lucas counties draining directly into the Maumee River is comparatively small. Most drainage flows into other rivers, Maumee Bay, or Lake Erie.

1.3 SITE BACKGROUND AND HISTORY

The "Maumee Area of Concern Stage 2 Watershed Restoration Plan" states that when the Maumee River AOC was designated, it was primarily due to the large problem of agricultural runoff. However, upon further investigation, more problems were discovered, including former dumps and contaminated industrial sites, combined sewer overflows (CSO), and disposal of dredged materials.

Originally the delisting of the Maumee River AOC was based on restoration of 14 BUIs for the entire AOC. Impairment of beneficial use means a change in the chemical, physical, or biological integrity of the Great Lakes ecosystem. According to the Ohio EPA's Maumee RAP dated 1990, 10 of the 14 BUIs in the Maumee River AOC required restoration. These BUIs included the following:

- Restrictions on fish and wildlife consumption
- Eutrophication or undesirable algae

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

- Restrictions on drinking water consumption or taste and odor
- Degradation of fish and wildlife populations
- Beach closings (Recreational Contact)
- Fish tumors or other deformities
- Degradation of aesthetics
- Degradation of benthos
- Restriction on dredging activities
- Loss of fish and wildlife habitat

The Maumee RAP does not identify BUIs by watershed but for the entire Maumee River AOC because the only means of delisting in 1990 was through total restoration of the entire AOC. Since an incremental approach to delisting was adopted in 2001 by the U.S. Policy Committee, the 1990 RAP and its BUIs were re-evaluated with the help of other community partners. This re-evaluation was conducted based on data and information available in the late 1980s and early 1990s and resulted in the preparation of a BUI summary table for each watershed in the Maumee River AOC. These new tables allowed better determination of progress toward restoration of a watershed or a beneficial use.

1.4 POSSIBLE SOURCES OF CONTAMINATION

The biological communities in the Lower Maumee River have been identified as impaired. The land surrounding the Lower Maumee River project area is primarily industrial and commercial, with both current and historical contamination (**Figure 1-3**). These sources of contaminants include various industries, chemical plants, petroleum production, and wastewater outfalls. The "Maumee Area of Concern Stage 2 Watershed Restoration Plan" dated 2006 indicated elevated concentrations of polychlorinated biphenyls (PCB), polycyclic aromatic hydrocarbons (PAH), and heavy metals in surface sediment in the Lower Maumee River project area.

From 1910 to 1990, Jennison Wright ran a creosote operation and manufactured asphalt pavement sealer at an approximately 23-acre site located at 2332 Broadway Avenue in Toledo that it leased from two railroad companies (**Figure 1-3**). From October 1994 to April 1995, the

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Norfolk Southern Railway and Conrail railroads performed an initial cleanup called an "interim removal action." The cleanup was conducted to remove all vessels, structures, drums, waste piles, and residuals of creosote-contaminated soils (PAHs) for off-site disposal. A more detailed investigation by the railroads identified pollutants in soil and groundwater. In soil, these pollutants included PAHs, 1-methylnaphthalene, 2-methylnaphthalene, arsenic, barium, chromium, and mercury. Pollutants in shallow rock and bedrock groundwater included benzene, ethylbenzene, toluene, xylene, arsenic, barium, and PAHs.

The property located at 1968 Miami Street had been owned by the Pilkington North America and Libbey Owens Ford glassmaking companies (**Figure 1-3**). A site assessment indicated soil contaminated with arsenic and groundwater contaminated with arsenic, nickel, chromium, lead, and bis(2-ethylhexyl)phthalate at concentrations exceeding standards allowed for residential and commercial/industrial use. The current property owner voluntarily assessed the property and then conducted a site cleanup of sand ponds that had been used until the 1970s to dispose of wastewater from glassmaking operations.

1.5 PURPOSE OF STUDY AND PROJECT OBJECTIVE

The purpose of the Lower Maumee River GLLA project is to further define chemical contaminants in sediment, locate contaminated areas for additional evaluation, delineate hot spots, and attempt to identify any ongoing sources. The objective of this site characterization was to collect samples for chemical and physical properties analysis needed to support project area assessment and potential remediation activities.

1.6 COPCs AND TARGET ANALYTES

All sediment samples were analyzed for the following COPCs: Target Analyte List (TAL) metals (including mercury) and semivolatile organic compounds (SVOC). In addition, approximately 10% of all sediment samples collected were analyzed for Target Compound List (TCL) pesticides and PCB Aroclors. All sediment samples also were analyzed for physical properties, including % moisture, total organic carbon (TOC), and grain size.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

2. SITE CHARACTERIZATION ACTIVITIES

Site characterization activities were conducted from August 1 through 11, 2011, and included sediment sample collection and sediment characterization as discussed below.

2.1 SEDIMENT SAMPLE COLLECTION

The sample collection procedures are detailed in WESTON's QAPP dated July 2011. The data collected during characterization activities will be used to (1) evaluate the locations of the most heavily contaminated sediment and (2) focus areas for further evaluation and remediation.

The Lower Maumee River project area extends 5 river miles, bound on the downstream edge by the Interstate 280 bridge (Veterans' Glass City Skyway) and on the upstream edge just downstream of Walbridge Park in Toledo, Ohio (**Figure 1-2**). Most sediment sampling locations were selected using Visual Sampling Plan (VSP) software with a sample design based on detecting "hot spots" (local areas of elevated concentrations) with a 646-foot-radius and 95% confidence probability. Two sampling locations (LMR11-50 and LMR11-72) were chosen at two historic sampling locations within the project area boundaries previously identified as MAUMEE R DST LOF PONDS ADJ SUNKEN BARGE and MAUMEE R AT PORTSIDE DOCKS, respectively. However, proposed location LMR11-50 was moved closer to a nearby CSO location. Five sampling locations (LMR11-57, LMR11-59, LMR11-60, LMR11-62, and LMR11-63) were biased in an area where the City of Toledo is planning future development. Additionally, samples were not collected from the navigation channel.

A total of 337 sediment samples (including 303 investigative, 17 field split, and 17 duplicate samples) were collected from 84 sampling locations in the Lower Maumee River project area. **Table 2-1** presents the sampling location coordinates, and **Figure 2-1** shows the sediment sampling locations.

Where sediment recovery was adequate, samples typically were collected from the following intervals: 0 to 6, 6 to 24, 24 to 48, 48 to 72, 72 to 96, 96 to 120, 120 to 144, and 144 to 168 inches below sediment surface (bss). Except for the surface interval, each sampling interval was

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

typically 24 inches long. If less than 12 inches of sediment was encountered in the bottom interval, it typically was included with the previous interval. Location LMR11-09 was not sampled because of poor recovery. In addition, poor recovery was noted in the upper 24 inches of sediment at location LMR11-43. Sediment collected from each sampling depth interval was homogenized, and an aliquot of each sediment sample was submitted for laboratory analysis.

Upstream of Interstate 75, sediment volume was not expected to be adequate to allow collection of a sediment core at sampling locations near the center of the river. Therefore, only a surface sample from 0 to 6 inches bss was planned for collection using a ponar device at these locations. However, during site characterization activities, adequate core recovery was unexpectedly achieved at several locations near the center of the river upstream of Interstate 75. Samples were collected using a ponar device at many of these locations, and then the sampling team returned to several locations to collect a sediment core on a later date. **Table 2-2** presents the sampling and analysis summary, including the sample collection device (ponar or vibracore) for each sediment sample. **Figure 2-2** shows the sediment thickness at each sampling location during the sediment sampling activities.

Sediment cores were collected to depth of refusal or until native material was encountered. Sediment cores typically were collected using the GLNPO research vessel (R/V) Mudpuppy II. However, due to equipment problems with the Mudpuppy II, some sediment samples were collected using a vibracore device mounted to a pontoon boat.

A U.S. EPA Contract Laboratory Program (CLP) laboratory analyzed the samples for SVOCs, TAL metals (including mercury), PCB Aroclors, TCL pesticides, and % moisture. A WESTON-procured subcontracted laboratory, TestAmerica Burlington of Burlington, Vermont, analyzed the samples for grain size and TOC (**Table 2-2**). Section 3 discusses the sample analytical results.

2.2 SEDIMENT CHARACTERISTICS

During site characterization activities, sediment throughout the Lower Maumee River project area largely was uniform. Sediment consisted of dark-brown to black, silty sand and sandy silt

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

with fine to medium grains throughout. Areas near the shoreline and Corbutt Island also had a surface deposit of well-graded gravel and cobbles. Organic materials were observed throughout much of the top 24 inches of sediment. An oily sheen was observed at location LMR11-69 as the core was extracted. Poor recovery (12 of 60 inches) was noted for this core, and woody debris was noted on the top of the core. A petroleum odor was noticed as cores were recovered from LMR11-50 and LMR11-72. A blue sheen was noted on the water surface as the core from LMR11-72 was recovered.

The maximum water depth encountered during sediment sampling was 22.5 feet. The maximum sediment depth measured was 175 inches at location LMR11-50. **Figure 2-2** shows the sediment thickness recovered at each core location during sediment sampling. **Appendix A** presents the sediment core logs, which provide additional detail regarding the geologic profile and water and sediment depth at each sampling location.

3. SAMPLE ANALYTICAL RESULTS

This section summarizes analytical results for the site characterization samples collected from August 1 through 11, 2011. A total of 337 sediment samples (303 investigative, 17 field split, and 17 duplicate samples) were collected from 84 sampling locations in the Lower Maumee River project area. The table below summarizes the analytical parameters for the investigative samples collected.

Analysis	Sampling Depth (inches bss)							
	0- 6	6- 24	24- 48	48- 72	72- 96	96- 120	120- 144	144- 168
SVOCs	83	66	58	45	30	16	3	2
TAL Metals	83	66	58	45	30	16	3	2
PCB Aroclors	7	13	6	2	1	0	0	0
Pesticides	7	13	6	2	1	0	0	0
Grain Size	81	66	58	45	30	16	3	2
TOC	83	66	58	45	30	16	3	2

The sample results for SVOCs, metals (including mercury), PCBs, and pesticides were compared to Probable Effect Concentrations (PEC) set forth in the document "Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems" (by D.D. MacDonald, et. al., dated 2000). The metals results were also compared to Ohio-specific

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Sediment Reference Values (SRV) set forth in the "Ohio Ecological Risk Assessment Guidance Document" dated February 2003 and revised in April 2008. Ecological Screening Levels (ESL) for sediment as set forth in U.S. EPA Region 5's "Ecological Screening Levels" dated 2003 are also presented as a secondary source of screening criteria and are used for comparison when PECs are not available.

The PECs and ESLs provide screening criteria to evaluate sediment chemistry data. PECs are defined as concentrations above which adverse effects are expected to occur and are the primary screening criteria for this characterization project. The ESLs represent a protective benchmark (for example, water quality criteria, sediment quality guidelines and criteria, and chronic no adverse effect levels) and are the secondary screening criteria. Sample results are compared to ESLs for chemicals that do not have a developed PEC, as discussed in sections 3.1 through 3.4. The Ohio-specific SRVs were developed to identify representative background sediment concentrations for lotic (flowing) water bodies. The SRVs may be used in conjunction with or instead of generating site-specific background concentrations for metals to determine if sediment potentially has been impacted. The SRVs are used as a screening tool for sites that have identified potential sediment contamination in lotic water bodies. Metals concentrations are compared to SRVs for chemicals that do not have a developed PEC as discussed in section 3.2.

Tables 3-1, 3-2, and 3-3 summarize the analytical results for SVOCs, TAL metals, and pesticides, respectively, by sediment depth sampling interval. These tables include the number of samples analyzed per depth interval; the number and percent of detected results; minimum and maximum detected concentrations; screening criteria; and the number of samples exceeding the screening criteria. **Appendix B** presents tables of the complete analytical results compared to PECs. The **Appendix B** tables summarize the sample results for % moisture, TOC, and grain size but do not compare these results to numerical screening criteria. **Appendix C** provides a photographic log of site conditions and sampling activities.

The sections below compare the analytical data to the screening criteria, when available, for SVOCs, TAL metals, PCBs, TCL pesticides, and physical properties.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

3.1 SVOCs

A total of 337 (303 investigative, 17 field split, and 17 duplicate) sediment samples were analyzed for SVOCs. **Table 3-1** summarizes the analytical results for SVOCs by sediment depth sampling interval. **Table B-1** in **Appendix B** provides the complete analytical results. Thirty SVOCs were detected in the sediment samples:

- 1,1'-Biphenyl
- 2-Methylnaphthalene
- 2-Methylphenol
- 4-Chloroaniline
- 4-Methylphenol
- Acenaphthene
- Acenaphthylene
- Acetophenone
- Anthracene
- Benzo(a)anthracene
- Benzo(a)pyrene
- Benzo(b)fluoranthene
- Benzo(g,h,i)perylene
- Benzo(k)fluoranthene
- Bis(2-ethylhexyl)phthalate
- Butylbenzylphthalate
- Caprolactam
- Carbazole
- Chrysene
- Dibenzo(a,h)anthracene
- Dibenzofuran
- Di-n-butylphthalate
- Di-n-octylphthalate
- Fluoranthene
- Fluorene
- Indeno(1,2,3-cd)pyrene
- Naphthalene
- Pentachlorophenol
- Phenanthrene
- Pyrene

Of the 30 SVOCs detected, the following PAHs were detected at concentrations that exceeded their respective PECs: anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene.

A total PAH 17 concentration was calculated for each sample by summing the concentration of each detected PAH in addition to all non-detect concentrations at one-half the detection limit for comparison to the total PAH PEC. Total PAH 17 and individual PAH concentrations exceeded the PECs at samples collected from locations LMR11-14 and LMR11-69 at the surface interval of 0 to 6 inches bss. **Figure 3-1** shows the locations where total PAH results exceeded the PEC

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

of 22,800 micrograms per kilogram (µg/kg). Anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, phenanthrene, and pyrene exceeded their respective PECs in the sample collected from location LMR11-14 from 0 to 6 inches bss. The calculated total PAH 17 concentration for sample LMR11-14-006 was 92,474.2 µg/kg, which exceeds the total PAH PEC of 22,800 µg/kg. LMR11-14 is near Corbutt Island in the upstream portion of the project area. Concentrations of PAHs exceeding PECs were detected only in the upper 6 inches of sediment at LMR11-14. The downstream side of Corbutt Island, where LMR11-14 is located, is a depositional zone for sediments. Sediment samples collected from deeper intervals at LMR11-14 did not contain PAHs at concentrations exceeding PECs.

The calculated total PAH 17 concentration for sample LMR11-69-006 was 297,600 µg/kg, which exceeds the total PAH PEC of 22,800 µg/kg. Anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene exceeded their respective PECs in the sample collected from LMR11-69 from 0 to 6 inches bss. Sediment recovery was poor at location LMR11-69 so deeper samples were not collected from this location. Therefore, the vertical extent of PAHs at concentrations exceeding the PECs is not defined at this location. LMR11-69 was located near the mouth where Swan Creek discharges into the Maumee River. Concurrent sampling by GLNPO detected elevated concentrations of PAHs in Swan Creek (WESTON's Sediment Assessment Report-Swan Creek dated January 6, 2012).

Samples collected from 0 to 6 inches bss at LMR11-14 and LMR11-69 primarily consisted of sand (greater than 75%). Deeper samples from LMR11-14 consisted of higher percentages of silt and clay than samples from the surface interval. Grain size results are discussed in Section 3.5.

Additionally, although the total PAH value did not exceed the PEC, naphthalene and phenanthrene were detected at concentrations exceeding their PECs at sample location LMR11-50 at a depth of 72 to 96 inches bss. LMR11-50 was located near a CSO, which may be the source of PAHs detected in this area of the river.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

PECs have not been developed for the following detected SVOCs that are not PAHs: 1,1'-biphenyl, 2-methylphenol, 4-chloroaniline, 4-methylphenol, acetophenone, bis(2-ethylhexyl)phthalate, butylbenzylphthalate, caprolactam, carbazole, dibenzofuran, di-n-butylphthalate, di-n-octylphthalate, and pentachlorophenol. ESLs are available for comparison for all of these chemicals except 1,1-biphenyl, acetophenone, caprolactam, and carbazole. Concentrations of the following exceeded their respective ESLs: 4-methylphenol, bis(2-ethylhexyl)phthalate, butylbenzylphthalate, and dibenzofuran. Detected concentrations of the following did not exceed their respective ESLs: 2-methylphenol, 4-chloroaniline, di-n-butylphthalate, di-n-octylphthalate, and pentachlorophenol.

The highest concentration of bis(2-ethylhexyl)phthalate (1,500 µg/kg) and the only concentration of dibenzofuran (3,200 µg/kg) exceeding their respective ESLs of 182 and 449 µg/kg were detected in sample LMR11-69-006 where elevated concentrations of PAHs were detected. The highest concentrations of 4-methylphenol were detected in samples collected from LMR11-50, which is located near a CSO. Butylbenzylphthalate concentrations exceeded the ESL of 1,970 µg/kg in only one sample, LMR11-63-006 at a concentration of 7,100 µg/kg. Per the Agency for Toxic Substances and Disease Registry (ATSDR) *Toxicological Profile for Wood Creosote, Coal Tar Creosote, Coal Tar, Coal Tar Pitch, and Coal Tar Pitch Volatiles* (September 2002), 4-methylphenol is an component of wood creosote and dibenzofuran is an component of coal tar creosote.

3.2 TAL METALS

A total of 337 (303 investigative, 17 field split, and 17 duplicate) sediment samples were analyzed for metals. **Table 3-2** summarizes the analytical results for metals by sediment depth sampling interval. **Table B-2** in **Appendix B** provides the complete analytical results. Twenty-two TAL metals were detected in the sediment samples:

- Aluminum
- Antimony
- Arsenic
- Barium
- Beryllium
- Cadmium
- Calcium
- Chromium
- Cobalt
- Copper

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

- Iron
- Lead
- Magnesium
- Manganese
- Mercury
- Nickel
- Potassium
- Selenium
- Silver
- Sodium
- Vanadium
- Zinc

Thallium was the only TAL metal not detected in at least one sediment sample. Of the 22 TAL metals detected, PECs have been developed for the following nine TAL metals: arsenic, cadmium, chromium, copper, lead, mercury, nickel, and zinc. The following TAL metals were detected at concentrations exceeding their respective PECs in at least one sample: arsenic, cadmium, chromium, lead, mercury, and zinc. **Figure 3-2** shows the locations where TAL metals results exceeded the PECs. Metals exceeding PECs were noted throughout the investigation area in mostly samples collected closer to the shores. The maximum concentration of lead in sediment, 419 milligrams per kilogram (mg/kg), was detected in a sample collected from location LMR11-69 from 0 to 6 inches bss. Elevated concentrations of PAHs also were detected in this sample which is located near the mouth of Swan Creek. High concentrations of lead also were detected in samples collected from LMR11-63 and LMR11-64 near the Clayton Street/Woodville Road Bridge (Anthony Wayne High Level Bridge).

The maximum concentration of mercury in sediment, 5.6 mg/kg, was detected in a sample collected from LMR11-72 from 0 to 6 inches bss. A petroleum odor and a blue sheen on the water were noticed as the core at LMR11-72 was recovered. Sampling location LMR11-72 was placed at a historic sampling location previously identified as MAUMEE R AT PORTSIDE DOCKS, where elevated metals concentrations have been detected.

PECs have not been developed for the following metals: aluminum, antimony, barium, beryllium, calcium, cobalt, iron, magnesium, manganese, potassium, selenium, silver, sodium, thallium, and vanadium. Ohio-specific SRVs representing background sediment concentrations for lotic (flowing) water bodies are available for the following TAL metals without PECs: aluminum, antimony, barium, calcium, iron, magnesium, manganese, potassium, and selenium. **Figure 3-3** shows locations where results for TAL metals without PECs exceeded the SRVs.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

3.3 PCBs

A total of 33 (29 investigative, 2 field split, and 2 duplicate) sediment samples were analyzed for PCB Aroclors. **Table B-3** in **Appendix B** provides the complete analytical results. PCB Aroclors were not detected in any sediment sample. PCBs were not originally identified as a major contaminant of concern, and more sampling may be needed to identify the nature and extent of PCB contamination.

3.4 TCL PESTICIDES

A total of 33 (29 investigative, 2 field split, and 2 duplicate) sediment samples were analyzed for TCL pesticides. **Table 3-3** summarizes the analytical results for pesticides by sediment depth sampling interval. **Table B-4** in **Appendix B** provides the complete analytical results. Six TCL pesticides were detected in the sediment samples:

- Aldrin
- Beta-BHC
- Endrin aldehyde
- Gamma-BHC (Lindane)
- Gamma-chlordane
- Heptachlor

Of the six detected pesticides, PECs have been developed for gamma-BHC and gamma-chlordane. Detected concentrations of gamma-BHC and gamma-chlordane did not exceed their respective PECs. PECs have not been developed for aldrin, beta-BHC, endrin aldehyde, or heptachlor. ESLs are available for these chemicals. Of these chemicals, heptachlor was the only chemical detected at concentrations exceeding the ESL. Heptachlor concentrations exceeded the ESL of 0.6 µg/kg in two samples, LMR11-12-006 at a concentration of 2.7 µg/kg and LMR11-26-024 at a concentration of 1.9 µg/kg.

3.5 PHYSICAL PROPERTIES

Grain size analysis was conducted on a total of 318 (301 investigative and 17 field split) sediment samples, and TOC analysis was conducted on a total of 337 (303 investigative, 17 field split, and 17 duplicate) sediment samples. **Table B-5** of **Appendix B** provides the complete analytical results. The geotechnical results for the 318 samples collected for grain size analysis

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

indicate that the material sampled consisted of a mixture of fine sand, silt, and clay. The average composition was 27% sand, 28% silt, and 42% clay.

4. DATA COMPLETENESS

Data validation summaries were produced for each chemical analyte group. Data generated through the U.S. EPA CLP underwent an initial performance assessment and compliance screening check performed and uploaded by the Sample Management Office (SMO) to the Electronic Data Exchange and Evaluation System (EXES) website. These checks were conducted to confirm conformance with the U.S. EPA CLP National Functional Guidelines (NFG). After this assessment, Shaw Environmental and Infrastructure Inc., (Shaw) under subcontract to GLNPO, completed validation of the data generated by the U.S. EPA CLP (for SVOCs, TAL metals and mercury, PCB Aroclors, TCL pesticides, and % moisture analyses). Shaw performed Tier 2 validation on 5 to 10% of the samples and Tier 1 validation on the remaining 90 to 95%.

During the validation process, Shaw may have removed data qualifiers for following reasons:

- The EXES Software often J or R flag analytical results for temperature more precisely than U.S. CLP NFG standards. Data flags may have been removed in some instances where temperature was not out of range, but the software indicated it was.
- EXES generated flags may have been removed by validators because EXES does not decipher between multiple columns/calibrations.
- U.S. CLP NFG does not qualify for matrix spikes; EXES qualifies for spikes based on R2 guidance. Validation was conducted following U.S. EPA CLP NFGs and some flags may have been removed by the validator.
- Relative percent difference (RPD) over 40 are noted by validators and flagged with the dataset.

Data received from the subcontracted laboratory (TestAmerica Burlington) for all parameters except grain size were run through the Automated Data Review (ADR) checker. WESTON completed a 5% full manual data validation for all analyses conducted by the WESTON-

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

procured subcontractor laboratory (grain size and TOC). The following are the general guidelines used for the data validation:

- NFGs for Superfund Organic Methods Data Review, U.S. EPA, June 2008
- NFGs for Inorganic Superfund Data Review, U.S. EPA, January 2010

Data not covered in the NFGs were compared to applicable analytical method guidelines, the laboratory standard operating procedures (SOP), and guidelines described in the WESTON QAPP dated July 2011.

The data validation consisted of completing the GLNPO Quality Assurance/Quality Control (QA/QC) checklist and preparing a data narrative summary report for each chemical parameter, which included the following completeness and usability components:

- Summary of data review
- Minor problems (as applicable)
  - Holding times
  - Method blanks
  - Matrix spike/matrix spike duplicates
  - Surrogates
  - Calibration
  - Laboratory control samples
  - Laboratory duplicates
  - Field duplicate results
- Data quality indicator review
  - Sensitivity
  - Precision
  - Accuracy
  - Completeness

Based on the data validation and data usability assessment, all data are considered suitable for project decisions per the QAPP. All the data validation summaries have been submitted to GLNPO under separate cover along with all of the Shaw and WESTON Data Validation Summaries for inclusion into GLNPO's GLSED.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

5. SUMMARY

During the sediment investigation, a total of 337 sediment samples (including field split and duplicate samples) were collected from 84 sampling locations in the Lower Maumee project area. Where sediment recovery was adequate, samples typically were collected from the following intervals: 0 to 6, 6 to 24, 24 to 48, 48 to 72, 72 to 96, 96 to 120, 120 to 144, and 144 to 168 inches bss.

All sediment samples were analyzed for the COPCs TAL metals (including mercury) and SVOCs. In addition, approximately 10% of all sediment samples collected were analyzed for TCL pesticides and PCB Aroclors. All sediment samples also were analyzed for physical properties, including % moisture, TOC, and grain size.

The sample results for SVOCs, metals, PCBs, and pesticides were compared to PECs set forth in the document "Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems" (by D.D. MacDonald, et. al., dated 2000). The metals results were also compared to Ohio-specific SRVs set forth in the "Ohio Ecological Risk Assessment Guidance Document" dated February 2003, revised April 2008. ESLs for sediment as set forth in U.S. EPA Region 5's "Ecological Screening Levels" dated 2003 were presented as a secondary source of screening criteria for chemicals that do not have a developed PEC.

The PECs and ESLs provide screening criteria to evaluate sediment chemistry data. PECs are defined as concentrations above which adverse effects are expected to occur and are the primary screening criteria for this characterization project. The ESLs represent a protective benchmark (for example, water quality criteria, sediment quality guidelines and criteria, and chronic no adverse effect levels) and are the secondary screening criteria. The Ohio-specific SRVs were developed to identify representative background sediment concentrations for lotic (flowing) water bodies.

The sections below summarize the comparison of the analytical data to the screening levels, when available, for SVOCs, TAL metals (including mercury), PCBs, and TCL pesticides.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

5.1 SVOCs

Total PAH 17 and several individual PAHs (anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene) were detected at concentrations exceeding PECs.

Anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, phenanthrene, and pyrene exceeded their respective PECs in the sample collected from location LMR11-14 from 0 to 6 inches bss. The calculated total PAH 17 concentration for sample LMR11-14-006 was 92,474.2 µg/kg, which exceeds the total PAH PEC of 22,800 µg/kg. LMR11-14 is near Corbutt Island in the upstream portion of the project area. Concentrations of PAHs exceeding PECs were detected only in the upper 6 inches of sediment at LMR11-14. The downstream side of Corbutt Island, where LMR11-14 is located, is a depositional zone for sediments. Sediment samples collected from deeper intervals at LMR11-14 did not contain PAHs at concentrations exceeding PECs. The 0 to 6 inch bss sample at LMR11-14 consisted primarily of sand (greater than 75%) whereas deeper samples at LMR11-14 consisted of higher percentages of silt and clay.

Anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene exceeded their respective PECs in the sample collected from LMR11-69 from 0 to 6 inches bss. The calculated total PAH 17 concentration for sample LMR11-69-006 was 297,600 µg/kg, which exceeds the total PAH PEC of 22,800 µg/kg. Sediment recovery was poor at location LMR11-69 so deeper samples were not collected from this location. Therefore, the vertical extent of PAHs at concentrations exceeding the PECs is not defined. LMR11-69 was located near the mouth where Swan Creek discharges into the Maumee River. Elevated concentrations of PAHs have been detected in Swan Creek. The 0 to 6 inch bss sample at LMR11-69 consisted primarily of sand (greater than 75%).

Naphthalene and phenanthrene were detected at concentrations exceeding their PECs at sample location LMR11-50 at a depth of 72 to 96 inches bss. LMR11-50 was located near a CSO, which may be the source of PAHs detected in this area of the river.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

5.2 TAL METALS

Metals exceeding PECs were noted throughout the investigation area, mostly in samples collected closer to the shores. The following TAL metals were detected at concentrations exceeding their respective PECs in at least one sample: arsenic, cadmium, chromium, lead, mercury, and zinc. The maximum concentration of lead in sediment, 419 mg/kg, was detected in a sample collected from location LMR11-69 from 0 to 6 inches bss. Elevated concentrations of PAHs also were detected in this sample which is located near the mouth of Swan Creek. High concentrations of lead also were detected in samples collected from LMR11-63 and LMR11-64 near the Clayton Street / Woodville Road Bridge (Anthony Wayne High Level Bridge).

The maximum concentration of mercury in sediment, 5.6 mg/kg, was detected in a sample collected from LMR11-72 from 0 to 6 inches bss. A petroleum odor and a blue sheen on the water were noticed as the core at LMR11-72 was recovered. Sampling location LMR11-72 was placed at a historic sampling location previously identified as MAUMEE R AT PORTSIDE DOCKS, where elevated metals concentrations have been detected.

Sample location LMR11-72 is directly downstream from sample location LMR11-69 which also showed elevated concentrations of metals.

5.3 PCBs

PCBs were not identified as a contaminant of concern for this site. While a subset of sediment samples were analyzed for PCBs, they were not detected in any sediment samples collected during site characterization activities.

5.4 TCL PESTICIDES

Detected concentrations of pesticides did not exceed their respective PECs in any samples collected during the site characterization activities.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

6. NEXT STEPS

The purpose of the Lower Maumee River GLLA project is to further define chemical contaminants in sediment, locate contaminated areas for additional evaluation, delineate hot spots, and attempt to identify any ongoing sources. The objective of this site characterization was to collect samples for chemical and physical properties analysis needed to support project area assessment and potential remediation activities.

The data collected during the site characterization activities conducted for the Lower Maumee River project area is sufficient to meet the site characterization objectives. The data gaps and recommendations for future work to meet the objectives of the GLLA project are as follows:

- Delineate hot spots of contamination and determine the nature and extent of PAH and metal contamination in the Lower Maumee River project area.
- Identify any on-going sources of contamination.
    - Determine sources of potential upstream contamination.
    - Determine the influence of contamination from Swan Creek on the project area.
    - Determine the impact of CSOs on the project area.
- Estimate the bioavailability of contaminants of concern using Equilibrium Partitioning Sediment Benchmarks (ESBs) and determine ESB Toxic Units (ESBTU).
- Where bioaccumulative chemicals are present in sediment, it may be necessary to evaluate fish tissue and/or water column data in addition to sediment data in order to determine appropriate sediment management options.
- Evaluate metal toxicity through an indirect estimate of bioavailability based on concentrations of Simultaneously Extracted Metals (SEM).
- Estimate the volume of contaminated sediments.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

	LMR11-85-074	Vibracore	48 - 74	8/5/2011	X	X			X	X
Total number of samples analyzed:					337	337	33	33	318	337

Notes:
bss - Below sediment surface
DP - Duplicate
FS - Field split
ID - Identification
PCB - Polychlorinated biphenyl
SVOC - Semivolatile organic compound
TOC - Total organic carbon
TAL - Target Analyte List
TCL - Target Compound List

This document shall not be disclosed without the express written permission of U.S. EPA.

Notes:
% - Percent
"--" - Not applicable
µg/kg - Microgram per kilogram
bss - Below sediment surface
ESL - Ecological Screening Level
NL - Not listed
PEC - Probable Effect Concentration
SRV - Sediment Reference Value
1 From "Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems" (MacDonald, et. al., 2000)
2 From U.S. Environmental Protection Agency Region 5 Ecological Screening Levels, 2003
3 Total PAH 17 - Calculated as sum of detections plus one-half the detection limit for nondetected results

This document shall not be disclosed without the express written permission of U.S. EPA.

Notes:
Result exceeds PEC
DP - Duplicate
FS - Field split
ID - Identification
in bss - Inches below sediment surface
J - Estimated value
J+ - Estimated value, biased high
J- - Estimated value, biased low
mg/kg - milligram per kilogram
NL - Not Listed
PEC - Probable Effect Concentration
U - Not detected
[1] Consensus-based PEC values (2000)

This document shall not be disclosed without the express written permission of U.S. EPA.

Notes:

µg/kg - Microgram per kilogram
DP - Duplicate
FS - Field split
ID - Identification
in bss - Inches below sediment surface
J - Estimated value
NL - Not Listed
PCB - Polychlorinated biphenyl
PEC - Probable Effect Concentration
U - Not detected
[1] Consensus-based PEC values (2000)

EXECUTIVE SUMMARY

Weston Solutions, Inc. (WESTON®) has prepared this Sediment Assessment Report to summarize site characterization activities conducted for the Lower Maumee River project area in Toledo, Lucas County, Ohio as part of the Maumee River Area of Concern (AOC) United States Environmental Protection Agency (U.S. EPA) Great Lakes National Program Office (GLNPO) Great Lakes Legacy Act (GLLA) Project. The purpose of the GLLA project is to further define chemical contaminants in sediment, locate contaminated areas for additional evaluation, delineate hotspots, and attempt to identify any ongoing sources. The objective of this site characterization was to collect samples for chemical and physical properties analysis needed to support project area assessment and potential remediation activities.

When the Maumee River AOC was designated, it was primarily due to the large problem of agricultural runoff. However, upon further investigation, more problems were discovered, including former dumps and contaminated industrial sites, combined sewer overflows (CSO), and disposal of dredged materials. The biological communities in the Lower Maumee River have been identified as impaired. The land surrounding the Lower Maumee River project area is primarily industrial and commercial, with both current and historical sources of contamination. These sources of contaminants include various industries, chemical plants, petroleum production, and wastewater outfalls. The "Maumee Area of Concern Stage 2 Watershed Restoration Plan" dated 2006 indicated elevated concentrations of polychlorinated biphenyls (PCB), polycyclic aromatic hydrocarbons (PAH), and heavy metals in surface sediment in the Lower Maumee River project area.

The Lower Maumee River project area extends 5 river miles and is bound on the downstream edge by the Interstate 280 bridge (Veterans' Glass City Skyway) and on the upstream edge just downstream of Walbridge Park in Toledo, Ohio. During the site characterization, a total of 337 sediment samples (including 303 investigative, 17 field split, and 17 duplicate samples) were collected from 84 sampling locations in the Lower Maumee River project area. The sample design was based on detecting "hot spots" (local areas of elevated concentration) with a 646-foot-radius and a 95% confidence probability.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Where sediment recovery was adequate, samples typically were collected from the following intervals: 0 to 6, 6 to 24, 24 to 48, 48 to 72, 72 to 96, 96 to 120, 120 to 144, and 144 to 168 inches below sediment surface (bss). Sediment volume was not expected to be adequate to allow collection of a sediment core at sampling locations near the center of the river upstream of Interstate 75. Therefore, only a surface sample from 0 to 6 inches bss was planned for collection using a ponar device at these locations. However, during site characterization activities, adequate core recovery was unexpectedly achieved at several locations near the center of the river upstream of Interstate 75. Samples were collected using a ponar device at many of these locations, and then the sampling team returned to several locations to collect a sediment core on a later date. Sediment cores were collected to depth of refusal or until native material was encountered. Sediment cores typically were collected using the GLNPO research vessel (R/V) Mudpuppy II. However, due to equipment problems with the Mudpuppy II, some sediment samples were collected using a vibracore device mounted to a pontoon boat.

All sediment samples were analyzed for the contaminants of potential concern (COPC): Target Analyte List (TAL) metals (including mercury) and semivolatile organic compounds (SVOC). In addition, approximately 10 percent (%) of all sediment samples collected were analyzed for Target Compound List (TCL) pesticides and PCB Aroclors. All sediment samples also were analyzed for physical properties, including % moisture, total organic carbon (TOC), and grain size.

The sample results for SVOCs, metals, PCBs, and pesticides were compared to Probable Effect Concentrations (PEC) set forth in the document "Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems" (by D.D. MacDonald, et. al., dated 2000). The metals results were also compared to Ohio-specific Sediment Reference Values (SRV) set forth in the "Ohio Ecological Risk Assessment Guidance Document" dated February 2003, revised April 2008. Ecological Screening Levels (ESL) for sediment as set forth in U.S. EPA Region 5's "Ecological Screening Levels" dated 2003 were presented as a secondary source of screening criteria for SVOCs, metals, PCBs, and pesticides that do not have a developed PEC.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

The PECs and ESLs provide screening criteria to evaluate sediment chemistry data. PECs are defined as concentrations above which adverse effects are expected to occur and are the primary screening criteria for this characterization project. The ESLs represent a protective benchmark (for example, water quality criteria, sediment quality guidelines and criteria, and chronic no adverse effect levels) and are the secondary screening criteria. The Ohio-specific SRVs were developed to identify representative background sediment concentrations for lotic (flowing) water bodies.

The paragraphs below summarize the comparison of the analytical data to the screening levels, when available, for SVOCs, TAL metals, PCBs, and TCL pesticides.

SVOCs

Total PAH 17 and several individual PAHs (anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene) were detected at concentrations exceeding PECs.

Anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, phenanthrene, and pyrene exceeded their respective PECs in the sample collected from location LMR11-14 from 0 to 6 inches bss. The calculated total PAH 17 concentration for sample LMR11-14-006 was 92,474.2 micrograms per kilogram (µg/kg), which exceeds the total PAH PEC of 22,800 µg/kg. LMR11-14 is near Corbutt Island in the upstream portion of the project area. Concentrations of PAHs exceeding PECs were detected only in the upper 6 inches of sediment at LMR11-14, which may be attributable to sediment deposited from upstream areas. The downstream side of Corbutt Island, where LMR11-14 is located, is a depositional zone for sediments. Sediment samples collected from deeper intervals at LMR11-14 did not contain PAHs at concentrations exceeding PECs. The 0 to 6 inch bss sample at LMR11-14 consisted primarily of sand (greater than 75%) whereas deeper samples at LMR11-14 consisted of higher percentages of silt and clay.

Anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene exceeded their respective PECs in the sample collected from LMR11-

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

69 from 0 to 6 inches bss. The calculated total PAH 17 concentration for sample LMR11-69-006 was 297,600 µg/kg, which exceeds the total PAH PEC of 22,800 µg/kg. Sediment recovery was poor at location LMR11-69 so deeper samples were not collected from this location. Therefore, the vertical extent of PAHs at concentrations exceeding the PECs is not defined. LMR11-69 was located near the mouth where Swan Creek discharges into the Maumee River. Elevated concentrations of PAHs have been detected in Swan Creek. The 0 to 6 inch bss sample at LMR11-69 consisted primarily of sand (greater than 75%).

Naphthalene and phenanthrene were detected at concentrations exceeding their PECs at sample location LMR11-50 at a depth of 72 to 96 inches bss. LMR11-50 was located near a CSO, which may be the source of PAHs detected in this area of the river.

TAL METALS

Metals exceeding PECs were noted throughout the investigation area, mostly in samples collected closer to the shores. The following TAL metals were detected at concentrations exceeding their respective PECs in at least one sample: arsenic, cadmium, chromium, lead, mercury, and zinc. The maximum concentration of lead in sediment, 419 milligrams per kilogram (mg/kg), was detected in a sample collected from location LMR11-69 from 0 to 6 inches bss. Elevated concentrations of PAHs also were detected in this sample which is located near the mouth of Swan Creek. High concentrations of lead also were detected in samples collected from LMR11-63 and LMR11-64 near the Clayton Street/Woodville Road bridge (Anthony Wayne High Level Bridge).

The maximum concentration of mercury in sediment, 5.6 mg/kg, was detected in a sample collected from LMR11-72 from 0 to 6 inches bss. A petroleum odor and a blue sheen on the water were noticed as the core at LMR11-72 was recovered. Sampling location LMR11-72 was placed at a historic sampling location previously identified as MAUMEE R AT PORTSIDE DOCKS, where elevated metals concentrations have been detected.

Sample location LMR11-72 is directly downstream from sample location LMR11-69 which also showed elevated concentrations of metals.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

PCBs

PCBs were not identified as a contaminant of concern for this site. While a subset of sediment samples were analyzed for PCBs, they were not detected in any sediment samples collected during site characterization activities.

TCL PESTICIDES

Detected concentrations of pesticides did not exceed their respective PECs in any samples collected during site characterization activities.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

1. INTRODUCTION

Weston Solutions, Inc. (WESTON®), has prepared this Sediment Assessment Report to summarize site characterization activities conducted for the Lower Maumee River project area in Toledo, Lucas County, Ohio (**Figure 1-1**). WESTON prepared the Sediment Assessment Report in response to a request from the United States Environmental Protection Agency (U.S. EPA) Great Lakes National Program Office (GLNPO) under Superfund Technical Assessment and Response Team (START) III Contract No. EP-S5-06-04, Technical Direction Document (TDD) No. S05-0008-1103-006. The site characterization activities were conducted as part of the Maumee River Area of Concern (AOC) Great Lakes Legacy Act (GLLA) project. The purpose of the GLLA project is to define chemical contaminants in sediment, locate contaminated areas for additional evaluation, delineate hotspots, and attempt to identify any ongoing sources. The data collection activities were conducted in accordance with WESTON's approved Quality Assurance Project Plan (QAPP) dated July 2011.

The sections below discuss the report organization, site description, site background and history, possible sources of contamination, the purpose of the study and project objectives, and contaminants of potential concern (COPC) and target analytes.

1.1 REPORT ORGANIZATION

This Sediment Assessment Report is organized as follows:

- Section 1 – Introduction
- Section 2 – Site Characterization Activities
- Section 3 – Sample Analytical Results
- Section 4 – Data Completeness
- Section 5 – Summary

Tables and figures are included after Section 5. **Appendix A** provides the sediment core logs, **Appendix B** provides analytical data tables for all samples collected, and **Appendix C** provides a photographic log of site conditions and sampling activities.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

1.2 SITE DESCRIPTION

The "Maumee Area of Concern Stage 2 Watershed Restoration Plan" states that the Maumee River begins in Fort Wayne at the confluence of the St. Joseph and St. Mary's Rivers and flows through Defiance and Napoleon and then on toward Toledo. Two major tributaries join the Maumee River: the Tiffin and Auglaize Rivers. In Wood and Lucas Counties, several smaller streams flow into the Maumee River: Beaver and Tontogany Creeks from the south and Swan Creek, which join the Maumee River in downtown Toledo.

The Maumee River travels more than 130 river miles to Lake Erie, 108 miles of which are located in Ohio. The Maumee River AOC does not include the entire Maumee River watershed. Instead, it includes the river's lower reach and tributaries as well as some neighboring watersheds (**Figure 1-1**). The boundaries of the Maumee River AOC originally were identified as the area extending from the Bowling Green water intake near Waterville (River Mile 22.8) along the Lower Maumee River downstream to Maumee Bay. The area includes direct drainage into the waters that are within Lucas, Ottawa, and Wood Counties and includes Swan Creek, Ottawa River (Tenmile Creek), Duck Creek, Otter Creek, Grassy Creek, Cedar Creek, and Crane Creek. In 1992, the AOC was expanded to include Packer Creek, Turtle Creek, Rusha Creek, and the Toussaint River. In 2010, the AOC boundaries were formally realigned to match the associated hydrologic units (**Figure 1-1**). The AOC's drainage area covers nearly all of Lucas County and parts of Fulton, Wood, Ottawa, and Sandusky Counties. The Maumee River AOC covers 787 square miles. The Maumee River has the largest drainage area of any Great Lakes river, with 3,942 stream miles.

The Lower Maumee River project area is located in the Maumee River AOC in Toledo, Lucas County, Ohio. The investigation area extends 5 river miles and is bound on the downstream edge by the Interstate 280 bridge (Veterans' Glass City Skyway) and on the upstream edge just downstream of Walbridge Park in Toledo, Ohio (**Figure 1-2**). The Ohio Environmental Protection Agency's (Ohio EPA) "Maumee Remedial Action Plan (RAP) Stage 1 Investigation Report" dated 1990 identified 10 beneficial use impairments (BUI) for the Maumee River AOC that also apply to the Lower Maumee River project area.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

The Maumee River subsurface consists of layers of bedrock with overlying layers of gravel, sand, silt, and clay left behind by glaciers and glacial lakes. Most regional bedrock is dolomite, a magnesium-bearing form of limestone. Smaller areas of sandstone and shale are present, especially in northwestern Lucas County.

The soils of the Maumee River are level to gently sloping and are very poorly to somewhat poorly drained. Lucas County formed in clayey and loamy, lake-laid sediment and water-reworked glacial till on broad flats of an old glacial lake.

The land area, or the watershed, that the Maumee River drains is 6,586 square miles, of which about 85 percent (%) is agricultural land. Daily average discharge ranges from a high of 94,000 cubic feet per second (cfs) to a low of 32 cfs and contributes about 25% of the total tributary discharge into Lake Erie exclusive of the Detroit River. The average annual rainfall in the river basin is 34.5 inches. The area in Wood and Lucas counties draining directly into the Maumee River is comparatively small. Most drainage flows into other rivers, Maumee Bay, or Lake Erie.

1.3 SITE BACKGROUND AND HISTORY

The "Maumee Area of Concern Stage 2 Watershed Restoration Plan" states that when the Maumee River AOC was designated, it was primarily due to the large problem of agricultural runoff. However, upon further investigation, more problems were discovered, including former dumps and contaminated industrial sites, combined sewer overflows (CSO), and disposal of dredged materials.

Originally the delisting of the Maumee River AOC was based on restoration of 14 BUIs for the entire AOC. Impairment of beneficial use means a change in the chemical, physical, or biological integrity of the Great Lakes ecosystem. According to the Ohio EPA's Maumee RAP dated 1990, 10 of the 14 BUIs in the Maumee River AOC required restoration. These BUIs included the following:

- Restrictions on fish and wildlife consumption
- Eutrophication or undesirable algae

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

- Restrictions on drinking water consumption or taste and odor
- Degradation of fish and wildlife populations
- Beach closings (Recreational Contact)
- Fish tumors or other deformities
- Degradation of aesthetics
- Degradation of benthos
- Restriction on dredging activities
- Loss of fish and wildlife habitat

The Maumee RAP does not identify BUIs by watershed but for the entire Maumee River AOC because the only means of delisting in 1990 was through total restoration of the entire AOC. Since an incremental approach to delisting was adopted in 2001 by the U.S. Policy Committee, the 1990 RAP and its BUIs were re-evaluated with the help of other community partners. This re-evaluation was conducted based on data and information available in the late 1980s and early 1990s and resulted in the preparation of a BUI summary table for each watershed in the Maumee River AOC. These new tables allowed better determination of progress toward restoration of a watershed or a beneficial use.

1.4 POSSIBLE SOURCES OF CONTAMINATION

The biological communities in the Lower Maumee River have been identified as impaired. The land surrounding the Lower Maumee River project area is primarily industrial and commercial, with both current and historical contamination (**Figure 1-3**). These sources of contaminants include various industries, chemical plants, petroleum production, and wastewater outfalls. The "Maumee Area of Concern Stage 2 Watershed Restoration Plan" dated 2006 indicated elevated concentrations of polychlorinated biphenyls (PCB), polycyclic aromatic hydrocarbons (PAH), and heavy metals in surface sediment in the Lower Maumee River project area.

From 1910 to 1990, Jennison Wright ran a creosote operation and manufactured asphalt pavement sealer at an approximately 23-acre site located at 2332 Broadway Avenue in Toledo that it leased from two railroad companies (**Figure 1-3**). From October 1994 to April 1995, the

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Norfolk Southern Railway and Conrail railroads performed an initial cleanup called an "interim removal action." The cleanup was conducted to remove all vessels, structures, drums, waste piles, and residuals of creosote-contaminated soils (PAHs) for off-site disposal. A more detailed investigation by the railroads identified pollutants in soil and groundwater. In soil, these pollutants included PAHs, 1-methylnaphthalene, 2-methylnaphthalene, arsenic, barium, chromium, and mercury. Pollutants in shallow rock and bedrock groundwater included benzene, ethylbenzene, toluene, xylene, arsenic, barium, and PAHs.

The property located at 1968 Miami Street had been owned by the Pilkington North America and Libbey Owens Ford glassmaking companies (**Figure 1-3**). A site assessment indicated soil contaminated with arsenic and groundwater contaminated with arsenic, nickel, chromium, lead, and bis(2-ethylhexyl)phthalate at concentrations exceeding standards allowed for residential and commercial/industrial use. The current property owner voluntarily assessed the property and then conducted a site cleanup of sand ponds that had been used until the 1970s to dispose of wastewater from glassmaking operations.

1.5 PURPOSE OF STUDY AND PROJECT OBJECTIVE

The purpose of the Lower Maumee River GLLA project is to further define chemical contaminants in sediment, locate contaminated areas for additional evaluation, delineate hot spots, and attempt to identify any ongoing sources. The objective of this site characterization was to collect samples for chemical and physical properties analysis needed to support project area assessment and potential remediation activities.

1.6 COPCs AND TARGET ANALYTES

All sediment samples were analyzed for the following COPCs: Target Analyte List (TAL) metals (including mercury) and semivolatile organic compounds (SVOC). In addition, approximately 10% of all sediment samples collected were analyzed for Target Compound List (TCL) pesticides and PCB Aroclors. All sediment samples also were analyzed for physical properties, including % moisture, total organic carbon (TOC), and grain size.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

2. SITE CHARACTERIZATION ACTIVITIES

Site characterization activities were conducted from August 1 through 11, 2011, and included sediment sample collection and sediment characterization as discussed below.

2.1 SEDIMENT SAMPLE COLLECTION

The sample collection procedures are detailed in WESTON's QAPP dated July 2011. The data collected during characterization activities will be used to (1) evaluate the locations of the most heavily contaminated sediment and (2) focus areas for further evaluation and remediation.

The Lower Maumee River project area extends 5 river miles, bound on the downstream edge by the Interstate 280 bridge (Veterans' Glass City Skyway) and on the upstream edge just downstream of Walbridge Park in Toledo, Ohio (**Figure 1-2**). Most sediment sampling locations were selected using Visual Sampling Plan (VSP) software with a sample design based on detecting "hot spots" (local areas of elevated concentrations) with a 646-foot-radius and 95% confidence probability. Two sampling locations (LMR11-50 and LMR11-72) were chosen at two historic sampling locations within the project area boundaries previously identified as MAUMEE R DST LOF PONDS ADJ SUNKEN BARGE and MAUMEE R AT PORTSIDE DOCKS, respectively. However, proposed location LMR11-50 was moved closer to a nearby CSO location. Five sampling locations (LMR11-57, LMR11-59, LMR11-60, LMR11-62, and LMR11-63) were biased in an area where the City of Toledo is planning future development. Additionally, samples were not collected from the navigation channel.

A total of 337 sediment samples (including 303 investigative, 17 field split, and 17 duplicate samples) were collected from 84 sampling locations in the Lower Maumee River project area. **Table 2-1** presents the sampling location coordinates, and **Figure 2-1** shows the sediment sampling locations.

Where sediment recovery was adequate, samples typically were collected from the following intervals: 0 to 6, 6 to 24, 24 to 48, 48 to 72, 72 to 96, 96 to 120, 120 to 144, and 144 to 168 inches below sediment surface (bss). Except for the surface interval, each sampling interval was

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

typically 24 inches long. If less than 12 inches of sediment was encountered in the bottom interval, it typically was included with the previous interval. Location LMR11-09 was not sampled because of poor recovery. In addition, poor recovery was noted in the upper 24 inches of sediment at location LMR11-43. Sediment collected from each sampling depth interval was homogenized, and an aliquot of each sediment sample was submitted for laboratory analysis.

Upstream of Interstate 75, sediment volume was not expected to be adequate to allow collection of a sediment core at sampling locations near the center of the river. Therefore, only a surface sample from 0 to 6 inches bss was planned for collection using a ponar device at these locations. However, during site characterization activities, adequate core recovery was unexpectedly achieved at several locations near the center of the river upstream of Interstate 75. Samples were collected using a ponar device at many of these locations, and then the sampling team returned to several locations to collect a sediment core on a later date. **Table 2-2** presents the sampling and analysis summary, including the sample collection device (ponar or vibracore) for each sediment sample. **Figure 2-2** shows the sediment thickness at each sampling location during the sediment sampling activities.

Sediment cores were collected to depth of refusal or until native material was encountered. Sediment cores typically were collected using the GLNPO research vessel (R/V) Mudpuppy II. However, due to equipment problems with the Mudpuppy II, some sediment samples were collected using a vibracore device mounted to a pontoon boat.

A U.S. EPA Contract Laboratory Program (CLP) laboratory analyzed the samples for SVOCs, TAL metals (including mercury), PCB Aroclors, TCL pesticides, and % moisture. A WESTON-procured subcontracted laboratory, TestAmerica Burlington of Burlington, Vermont, analyzed the samples for grain size and TOC (**Table 2-2**). Section 3 discusses the sample analytical results.

2.2 SEDIMENT CHARACTERISTICS

During site characterization activities, sediment throughout the Lower Maumee River project area largely was uniform. Sediment consisted of dark-brown to black, silty sand and sandy silt

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

with fine to medium grains throughout. Areas near the shoreline and Corbutt Island also had a surface deposit of well-graded gravel and cobbles. Organic materials were observed throughout much of the top 24 inches of sediment. An oily sheen was observed at location LMR11-69 as the core was extracted. Poor recovery (12 of 60 inches) was noted for this core, and woody debris was noted on the top of the core. A petroleum odor was noticed as cores were recovered from LMR11-50 and LMR11-72. A blue sheen was noted on the water surface as the core from LMR11-72 was recovered.

The maximum water depth encountered during sediment sampling was 22.5 feet. The maximum sediment depth measured was 175 inches at location LMR11-50. **Figure 2-2** shows the sediment thickness recovered at each core location during sediment sampling. **Appendix A** presents the sediment core logs, which provide additional detail regarding the geologic profile and water and sediment depth at each sampling location.

3. SAMPLE ANALYTICAL RESULTS

This section summarizes analytical results for the site characterization samples collected from August 1 through 11, 2011. A total of 337 sediment samples (303 investigative, 17 field split, and 17 duplicate samples) were collected from 84 sampling locations in the Lower Maumee River project area. The table below summarizes the analytical parameters for the investigative samples collected.

Analysis	Sampling Depth (inches bss)							
	0- 6	6- 24	24- 48	48- 72	72- 96	96- 120	120- 144	144- 168
SVOCs	83	66	58	45	30	16	3	2
TAL Metals	83	66	58	45	30	16	3	2
PCB Aroclors	7	13	6	2	1	0	0	0
Pesticides	7	13	6	2	1	0	0	0
Grain Size	81	66	58	45	30	16	3	2
TOC	83	66	58	45	30	16	3	2

The sample results for SVOCs, metals (including mercury), PCBs, and pesticides were compared to Probable Effect Concentrations (PEC) set forth in the document "Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems" (by D.D. MacDonald, et. al., dated 2000). The metals results were also compared to Ohio-specific

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Sediment Reference Values (SRV) set forth in the "Ohio Ecological Risk Assessment Guidance Document" dated February 2003 and revised in April 2008. Ecological Screening Levels (ESL) for sediment as set forth in U.S. EPA Region 5's "Ecological Screening Levels" dated 2003 are also presented as a secondary source of screening criteria and are used for comparison when PECs are not available.

The PECs and ESLs provide screening criteria to evaluate sediment chemistry data. PECs are defined as concentrations above which adverse effects are expected to occur and are the primary screening criteria for this characterization project. The ESLs represent a protective benchmark (for example, water quality criteria, sediment quality guidelines and criteria, and chronic no adverse effect levels) and are the secondary screening criteria. Sample results are compared to ESLs for chemicals that do not have a developed PEC, as discussed in sections 3.1 through 3.4. The Ohio-specific SRVs were developed to identify representative background sediment concentrations for lotic (flowing) water bodies. The SRVs may be used in conjunction with or instead of generating site-specific background concentrations for metals to determine if sediment potentially has been impacted. The SRVs are used as a screening tool for sites that have identified potential sediment contamination in lotic water bodies. Metals concentrations are compared to SRVs for chemicals that do not have a developed PEC as discussed in section 3.2.

Tables 3-1, 3-2, and 3-3 summarize the analytical results for SVOCs, TAL metals, and pesticides, respectively, by sediment depth sampling interval. These tables include the number of samples analyzed per depth interval; the number and percent of detected results; minimum and maximum detected concentrations; screening criteria; and the number of samples exceeding the screening criteria. **Appendix B** presents tables of the complete analytical results compared to PECs. The **Appendix B** tables summarize the sample results for % moisture, TOC, and grain size but do not compare these results to numerical screening criteria. **Appendix C** provides a photographic log of site conditions and sampling activities.

The sections below compare the analytical data to the screening criteria, when available, for SVOCs, TAL metals, PCBs, TCL pesticides, and physical properties.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

3.1 SVOCs

A total of 337 (303 investigative, 17 field split, and 17 duplicate) sediment samples were analyzed for SVOCs. **Table 3-1** summarizes the analytical results for SVOCs by sediment depth sampling interval. **Table B-1** in **Appendix B** provides the complete analytical results. Thirty SVOCs were detected in the sediment samples:

- 1,1'-Biphenyl
- 2-Methylnaphthalene
- 2-Methylphenol
- 4-Chloroaniline
- 4-Methylphenol
- Acenaphthene
- Acenaphthylene
- Acetophenone
- Anthracene
- Benzo(a)anthracene
- Benzo(a)pyrene
- Benzo(b)fluoranthene
- Benzo(g,h,i)perylene
- Benzo(k)fluoranthene
- Bis(2-ethylhexyl)phthalate
- Butylbenzylphthalate
- Caprolactam
- Carbazole
- Chrysene
- Dibenzo(a,h)anthracene
- Dibenzofuran
- Di-n-butylphthalate
- Di-n-octylphthalate
- Fluoranthene
- Fluorene
- Indeno(1,2,3-cd)pyrene
- Naphthalene
- Pentachlorophenol
- Phenanthrene
- Pyrene

Of the 30 SVOCs detected, the following PAHs were detected at concentrations that exceeded their respective PECs: anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene.

A total PAH 17 concentration was calculated for each sample by summing the concentration of each detected PAH in addition to all non-detect concentrations at one-half the detection limit for comparison to the total PAH PEC. Total PAH 17 and individual PAH concentrations exceeded the PECs at samples collected from locations LMR11-14 and LMR11-69 at the surface interval of 0 to 6 inches bss. **Figure 3-1** shows the locations where total PAH results exceeded the PEC

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

of 22,800 micrograms per kilogram (µg/kg). Anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, phenanthrene, and pyrene exceeded their respective PECs in the sample collected from location LMR11-14 from 0 to 6 inches bss. The calculated total PAH 17 concentration for sample LMR11-14-006 was 92,474.2 µg/kg, which exceeds the total PAH PEC of 22,800 µg/kg. LMR11-14 is near Corbutt Island in the upstream portion of the project area. Concentrations of PAHs exceeding PECs were detected only in the upper 6 inches of sediment at LMR11-14. The downstream side of Corbutt Island, where LMR11-14 is located, is a depositional zone for sediments. Sediment samples collected from deeper intervals at LMR11-14 did not contain PAHs at concentrations exceeding PECs.

The calculated total PAH 17 concentration for sample LMR11-69-006 was 297,600 µg/kg, which exceeds the total PAH PEC of 22,800 µg/kg. Anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene exceeded their respective PECs in the sample collected from LMR11-69 from 0 to 6 inches bss. Sediment recovery was poor at location LMR11-69 so deeper samples were not collected from this location. Therefore, the vertical extent of PAHs at concentrations exceeding the PECs is not defined at this location. LMR11-69 was located near the mouth where Swan Creek discharges into the Maumee River. Concurrent sampling by GLNPO detected elevated concentrations of PAHs in Swan Creek (WESTON's Sediment Assessment Report-Swan Creek dated January 6, 2012).

Samples collected from 0 to 6 inches bss at LMR11-14 and LMR11-69 primarily consisted of sand (greater than 75%). Deeper samples from LMR11-14 consisted of higher percentages of silt and clay than samples from the surface interval. Grain size results are discussed in Section 3.5.

Additionally, although the total PAH value did not exceed the PEC, naphthalene and phenanthrene were detected at concentrations exceeding their PECs at sample location LMR11-50 at a depth of 72 to 96 inches bss. LMR11-50 was located near a CSO, which may be the source of PAHs detected in this area of the river.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

PECs have not been developed for the following detected SVOCs that are not PAHs: 1,1'-biphenyl, 2-methylphenol, 4-chloroaniline, 4-methylphenol, acetophenone, bis(2-ethylhexyl)phthalate, butylbenzylphthalate, caprolactam, carbazole, dibenzofuran, di-n-butylphthalate, di-n-octylphthalate, and pentachlorophenol. ESLs are available for comparison for all of these chemicals except 1,1-biphenyl, acetophenone, caprolactam, and carbazole. Concentrations of the following exceeded their respective ESLs: 4-methylphenol, bis(2-ethylhexyl)phthalate, butylbenzylphthalate, and dibenzofuran. Detected concentrations of the following did not exceed their respective ESLs: 2-methylphenol, 4-chloroaniline, di-n-butylphthalate, di-n-octylphthalate, and pentachlorophenol.

The highest concentration of bis(2-ethylhexyl)phthalate (1,500 µg/kg) and the only concentration of dibenzofuran (3,200 µg/kg) exceeding their respective ESLs of 182 and 449 µg/kg were detected in sample LMR11-69-006 where elevated concentrations of PAHs were detected. The highest concentrations of 4-methylphenol were detected in samples collected from LMR11-50, which is located near a CSO. Butylbenzylphthalate concentrations exceeded the ESL of 1,970 µg/kg in only one sample, LMR11-63-006 at a concentration of 7,100 µg/kg. Per the Agency for Toxic Substances and Disease Registry (ATSDR) *Toxicological Profile for Wood Creosote, Coal Tar Creosote, Coal Tar, Coal Tar Pitch, and Coal Tar Pitch Volatiles* (September 2002), 4-methylphenol is an component of wood creosote and dibenzofuran is an component of coal tar creosote.

3.2 TAL METALS

A total of 337 (303 investigative, 17 field split, and 17 duplicate) sediment samples were analyzed for metals. **Table 3-2** summarizes the analytical results for metals by sediment depth sampling interval. **Table B-2** in **Appendix B** provides the complete analytical results. Twenty-two TAL metals were detected in the sediment samples:

- Aluminum
- Antimony
- Arsenic
- Barium
- Beryllium
- Cadmium
- Calcium
- Chromium
- Cobalt
- Copper

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

- Iron
- Lead
- Magnesium
- Manganese
- Mercury
- Nickel
- Potassium
- Selenium
- Silver
- Sodium
- Vanadium
- Zinc

Thallium was the only TAL metal not detected in at least one sediment sample. Of the 22 TAL metals detected, PECs have been developed for the following nine TAL metals: arsenic, cadmium, chromium, copper, lead, mercury, nickel, and zinc. The following TAL metals were detected at concentrations exceeding their respective PECs in at least one sample: arsenic, cadmium, chromium, lead, mercury, and zinc. **Figure 3-2** shows the locations where TAL metals results exceeded the PECs. Metals exceeding PECs were noted throughout the investigation area in mostly samples collected closer to the shores. The maximum concentration of lead in sediment, 419 milligrams per kilogram (mg/kg), was detected in a sample collected from location LMR11-69 from 0 to 6 inches bss. Elevated concentrations of PAHs also were detected in this sample which is located near the mouth of Swan Creek. High concentrations of lead also were detected in samples collected from LMR11-63 and LMR11-64 near the Clayton Street/Woodville Road Bridge (Anthony Wayne High Level Bridge).

The maximum concentration of mercury in sediment, 5.6 mg/kg, was detected in a sample collected from LMR11-72 from 0 to 6 inches bss. A petroleum odor and a blue sheen on the water were noticed as the core at LMR11-72 was recovered. Sampling location LMR11-72 was placed at a historic sampling location previously identified as MAUMEE R AT PORTSIDE DOCKS, where elevated metals concentrations have been detected.

PECs have not been developed for the following metals: aluminum, antimony, barium, beryllium, calcium, cobalt, iron, magnesium, manganese, potassium, selenium, silver, sodium, thallium, and vanadium. Ohio-specific SRVs representing background sediment concentrations for lotic (flowing) water bodies are available for the following TAL metals without PECs: aluminum, antimony, barium, calcium, iron, magnesium, manganese, potassium, and selenium. **Figure 3-3** shows locations where results for TAL metals without PECs exceeded the SRVs.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

3.3 PCBs

A total of 33 (29 investigative, 2 field split, and 2 duplicate) sediment samples were analyzed for PCB Aroclors. **Table B-3** in **Appendix B** provides the complete analytical results. PCB Aroclors were not detected in any sediment sample. PCBs were not originally identified as a major contaminant of concern, and more sampling may be needed to identify the nature and extent of PCB contamination.

3.4 TCL PESTICIDES

A total of 33 (29 investigative, 2 field split, and 2 duplicate) sediment samples were analyzed for TCL pesticides. **Table 3-3** summarizes the analytical results for pesticides by sediment depth sampling interval. **Table B-4** in **Appendix B** provides the complete analytical results. Six TCL pesticides were detected in the sediment samples:

- Aldrin
- Beta-BHC
- Endrin aldehyde
- Gamma-BHC (Lindane)
- Gamma-chlordane
- Heptachlor

Of the six detected pesticides, PECs have been developed for gamma-BHC and gamma-chlordane. Detected concentrations of gamma-BHC and gamma-chlordane did not exceed their respective PECs. PECs have not been developed for aldrin, beta-BHC, endrin aldehyde, or heptachlor. ESLs are available for these chemicals. Of these chemicals, heptachlor was the only chemical detected at concentrations exceeding the ESL. Heptachlor concentrations exceeded the ESL of 0.6 µg/kg in two samples, LMR11-12-006 at a concentration of 2.7 µg/kg and LMR11-26-024 at a concentration of 1.9 µg/kg.

3.5 PHYSICAL PROPERTIES

Grain size analysis was conducted on a total of 318 (301 investigative and 17 field split) sediment samples, and TOC analysis was conducted on a total of 337 (303 investigative, 17 field split, and 17 duplicate) sediment samples. **Table B-5** of **Appendix B** provides the complete analytical results. The geotechnical results for the 318 samples collected for grain size analysis

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

indicate that the material sampled consisted of a mixture of fine sand, silt, and clay. The average composition was 27% sand, 28% silt, and 42% clay.

4. DATA COMPLETENESS

Data validation summaries were produced for each chemical analyte group. Data generated through the U.S. EPA CLP underwent an initial performance assessment and compliance screening check performed and uploaded by the Sample Management Office (SMO) to the Electronic Data Exchange and Evaluation System (EXES) website. These checks were conducted to confirm conformance with the U.S. EPA CLP National Functional Guidelines (NFG). After this assessment, Shaw Environmental and Infrastructure Inc., (Shaw) under subcontract to GLNPO, completed validation of the data generated by the U.S. EPA CLP (for SVOCs, TAL metals and mercury, PCB Aroclors, TCL pesticides, and % moisture analyses). Shaw performed Tier 2 validation on 5 to 10% of the samples and Tier 1 validation on the remaining 90 to 95%.

During the validation process, Shaw may have removed data qualifiers for following reasons:

- The EXES Software often J or R flag analytical results for temperature more precisely than U.S. CLP NFG standards. Data flags may have been removed in some instances where temperature was not out of range, but the software indicated it was.
- EXES generated flags may have been removed by validators because EXES does not decipher between multiple columns/calibrations.
- U.S. CLP NFG does not qualify for matrix spikes; EXES qualifies for spikes based on R2 guidance. Validation was conducted following U.S. EPA CLP NFGs and some flags may have been removed by the validator.
- Relative percent difference (RPD) over 40 are noted by validators and flagged with the dataset.

Data received from the subcontracted laboratory (TestAmerica Burlington) for all parameters except grain size were run through the Automated Data Review (ADR) checker. WESTON completed a 5% full manual data validation for all analyses conducted by the WESTON-

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

procured subcontractor laboratory (grain size and TOC). The following are the general guidelines used for the data validation:

- NFGs for Superfund Organic Methods Data Review, U.S. EPA, June 2008
- NFGs for Inorganic Superfund Data Review, U.S. EPA, January 2010

Data not covered in the NFGs were compared to applicable analytical method guidelines, the laboratory standard operating procedures (SOP), and guidelines described in the WESTON QAPP dated July 2011.

The data validation consisted of completing the GLNPO Quality Assurance/Quality Control (QA/QC) checklist and preparing a data narrative summary report for each chemical parameter, which included the following completeness and usability components:

- Summary of data review
- Minor problems (as applicable)
  - Holding times
  - Method blanks
  - Matrix spike/matrix spike duplicates
  - Surrogates
  - Calibration
  - Laboratory control samples
  - Laboratory duplicates
  - Field duplicate results
- Data quality indicator review
  - Sensitivity
  - Precision
  - Accuracy
  - Completeness

Based on the data validation and data usability assessment, all data are considered suitable for project decisions per the QAPP. All the data validation summaries have been submitted to GLNPO under separate cover along with all of the Shaw and WESTON Data Validation Summaries for inclusion into GLNPO's GLSED.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

5. SUMMARY

During the sediment investigation, a total of 337 sediment samples (including field split and duplicate samples) were collected from 84 sampling locations in the Lower Maumee project area. Where sediment recovery was adequate, samples typically were collected from the following intervals: 0 to 6, 6 to 24, 24 to 48, 48 to 72, 72 to 96, 96 to 120, 120 to 144, and 144 to 168 inches bss.

All sediment samples were analyzed for the COPCs TAL metals (including mercury) and SVOCs. In addition, approximately 10% of all sediment samples collected were analyzed for TCL pesticides and PCB Aroclors. All sediment samples also were analyzed for physical properties, including % moisture, TOC, and grain size.

The sample results for SVOCs, metals, PCBs, and pesticides were compared to PECs set forth in the document "Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems" (by D.D. MacDonald, et. al., dated 2000). The metals results were also compared to Ohio-specific SRVs set forth in the "Ohio Ecological Risk Assessment Guidance Document" dated February 2003, revised April 2008. ESLs for sediment as set forth in U.S. EPA Region 5's "Ecological Screening Levels" dated 2003 were presented as a secondary source of screening criteria for chemicals that do not have a developed PEC.

The PECs and ESLs provide screening criteria to evaluate sediment chemistry data. PECs are defined as concentrations above which adverse effects are expected to occur and are the primary screening criteria for this characterization project. The ESLs represent a protective benchmark (for example, water quality criteria, sediment quality guidelines and criteria, and chronic no adverse effect levels) and are the secondary screening criteria. The Ohio-specific SRVs were developed to identify representative background sediment concentrations for lotic (flowing) water bodies.

The sections below summarize the comparison of the analytical data to the screening levels, when available, for SVOCs, TAL metals (including mercury), PCBs, and TCL pesticides.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

5.1 SVOCs

Total PAH 17 and several individual PAHs (anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene) were detected at concentrations exceeding PECs.

Anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, phenanthrene, and pyrene exceeded their respective PECs in the sample collected from location LMR11-14 from 0 to 6 inches bss. The calculated total PAH 17 concentration for sample LMR11-14-006 was 92,474.2 µg/kg, which exceeds the total PAH PEC of 22,800 µg/kg. LMR11-14 is near Corbutt Island in the upstream portion of the project area. Concentrations of PAHs exceeding PECs were detected only in the upper 6 inches of sediment at LMR11-14. The downstream side of Corbutt Island, where LMR11-14 is located, is a depositional zone for sediments. Sediment samples collected from deeper intervals at LMR11-14 did not contain PAHs at concentrations exceeding PECs. The 0 to 6 inch bss sample at LMR11-14 consisted primarily of sand (greater than 75%) whereas deeper samples at LMR11-14 consisted of higher percentages of silt and clay.

Anthracene, benzo(a)anthracene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene exceeded their respective PECs in the sample collected from LMR11-69 from 0 to 6 inches bss. The calculated total PAH 17 concentration for sample LMR11-69-006 was 297,600 µg/kg, which exceeds the total PAH PEC of 22,800 µg/kg. Sediment recovery was poor at location LMR11-69 so deeper samples were not collected from this location. Therefore, the vertical extent of PAHs at concentrations exceeding the PECs is not defined. LMR11-69 was located near the mouth where Swan Creek discharges into the Maumee River. Elevated concentrations of PAHs have been detected in Swan Creek. The 0 to 6 inch bss sample at LMR11-69 consisted primarily of sand (greater than 75%).

Naphthalene and phenanthrene were detected at concentrations exceeding their PECs at sample location LMR11-50 at a depth of 72 to 96 inches bss. LMR11-50 was located near a CSO, which may be the source of PAHs detected in this area of the river.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

5.2 TAL METALS

Metals exceeding PECs were noted throughout the investigation area, mostly in samples collected closer to the shores. The following TAL metals were detected at concentrations exceeding their respective PECs in at least one sample: arsenic, cadmium, chromium, lead, mercury, and zinc. The maximum concentration of lead in sediment, 419 mg/kg, was detected in a sample collected from location LMR11-69 from 0 to 6 inches bss. Elevated concentrations of PAHs also were detected in this sample which is located near the mouth of Swan Creek. High concentrations of lead also were detected in samples collected from LMR11-63 and LMR11-64 near the Clayton Street / Woodville Road Bridge (Anthony Wayne High Level Bridge).

The maximum concentration of mercury in sediment, 5.6 mg/kg, was detected in a sample collected from LMR11-72 from 0 to 6 inches bss. A petroleum odor and a blue sheen on the water were noticed as the core at LMR11-72 was recovered. Sampling location LMR11-72 was placed at a historic sampling location previously identified as MAUMEE R AT PORTSIDE DOCKS, where elevated metals concentrations have been detected.

Sample location LMR11-72 is directly downstream from sample location LMR11-69 which also showed elevated concentrations of metals.

5.3 PCBs

PCBs were not identified as a contaminant of concern for this site. While a subset of sediment samples were analyzed for PCBs, they were not detected in any sediment samples collected during site characterization activities.

5.4 TCL PESTICIDES

Detected concentrations of pesticides did not exceed their respective PECs in any samples collected during the site characterization activities.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

6. NEXT STEPS

The purpose of the Lower Maumee River GLLA project is to further define chemical contaminants in sediment, locate contaminated areas for additional evaluation, delineate hot spots, and attempt to identify any ongoing sources. The objective of this site characterization was to collect samples for chemical and physical properties analysis needed to support project area assessment and potential remediation activities.

The data collected during the site characterization activities conducted for the Lower Maumee River project area is sufficient to meet the site characterization objectives. The data gaps and recommendations for future work to meet the objectives of the GLLA project are as follows:

- Delineate hot spots of contamination and determine the nature and extent of PAH and metal contamination in the Lower Maumee River project area.
- Identify any on-going sources of contamination.
    - Determine sources of potential upstream contamination.
    - Determine the influence of contamination from Swan Creek on the project area.
    - Determine the impact of CSOs on the project area.
- Estimate the bioavailability of contaminants of concern using Equilibrium Partitioning Sediment Benchmarks (ESBs) and determine ESB Toxic Units (ESBTU).
- Where bioaccumulative chemicals are present in sediment, it may be necessary to evaluate fish tissue and/or water column data in addition to sediment data in order to determine appropriate sediment management options.
- Evaluate metal toxicity through an indirect estimate of bioavailability based on concentrations of Simultaneously Extracted Metals (SEM).
- Estimate the volume of contaminated sediments.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

	LMR11-85-074	Vibracore	48 - 74	8/5/2011	X	X			X	X
Total number of samples analyzed:					337	337	33	33	318	337

Notes:
bss - Below sediment surface
DP - Duplicate
FS - Field split
ID - Identification
PCB - Polychlorinated biphenyl
SVOC - Semivolatile organic compound
TOC - Total organic carbon
TAL - Target Analyte List
TCL - Target Compound List

This document shall not be disclosed without the express written permission of U.S. EPA.

Notes:
% - Percent
"--" - Not applicable
µg/kg - Microgram per kilogram
bss - Below sediment surface
ESL - Ecological Screening Level
NL - Not listed
PEC - Probable Effect Concentration
SRV - Sediment Reference Value
1 From "Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems" (MacDonald, et. al., 2000)
2 From U.S. Environmental Protection Agency Region 5 Ecological Screening Levels, 2003
3 Total PAH 17 - Calculated as sum of detections plus one-half the detection limit for nondetected results

This document shall not be disclosed without the express written permission of U.S. EPA.

SEDIMENT LOG OF LMR11-28

U.S. EPA Region V
Contract: EP-S5-06-04

Lower Maumee River
Toledo, Lucas County, Ohio

Collection Date	: 08-10-11	WESTON Geologist	: J. Colomb
Sample Date	: 08-10-11	X Coordinates	: 41 37.2645
Collector	: WESTON	Y Coordinates	: 83 33.0803
Collection Method	: Ponar/Vibracore		
Total Depth	: 34"		

Samples Collected
- Investigative Sample
- Duplicate Sample
- MS/MSD Sample

Analyses Performed
SVOCs, Total Metals/Hg,
TOC, Grain Size (TA)
PCB Aroclors, Pesticides (CLP)

DEPTH (ft)	GRAPHIC	USCS	DESCRIPTION	SAMPLE INTERVAL	REMARKS
0		ML	CLAYEY SILT, some fine to medium grained sand, grey-brown, trace organics, saturated, no odor		LMR11-28-06 (SVOCs, Total Metals/Hg, TOC, Grain Size)
1		ML	CLAYEY SILT, trace fine to medium grained sand, light brown, saturated, no odor		LMR11-28-34 (SVOCs, Total Metals/Hg, TOC, Grain Size, PCB Aroclors, Pesticides)
2					
3			END OF SEDIMENT BORING AT 34" bgs

SEDIMENT LOG OF LMR11-46

U.S. EPA Region V
Contract: EP-S5-06-04

Lower Maumee River
Toledo, Lucas County, Ohio

Collection Date.	: 08-08-11	WESTON Geologist	: J. Colomb
Sample Date	: 08-08-11	X Coordinates	: 41 37.542306
Collector	: WESTON	Y Coordinates	: 83 32.300440
Collection Method	: Ponar/Vibracore		
Total Depth	: 93"		

Samples Collected
- Investigative Sample
- Duplicate Sample
- MS/MSD Sample

Analyses Performed
SVOCs, Total Metals/Hg, TOC, Grain Size (TA)

DEPTH (ft)	USCS	DESCRIPTION	SAMPLE INTERVAL	REMARKS
0	ML	SILT, trace fine grained sand, dark brown, saturated, no odor		LMR11-46-06 (SVOCs, Total Metals/Hg, TOC, Grain Size)
1	ML	SILT, trace fine grained sand, dark brown, saturated, no odor		LMR11-46-24 (SVOCs, Total Metals/Hg, TOC, Grain Size) LMR11-46-24FS (SVOCs, Total Metals/Hg, TOC, Grain Size)
2	ML	SANDY SILT, fine grained sand, dark brown, saturated, no odor, fine to medium sand lens at 40"		
3				LMR11-46-48 (SVOCs, Total Metals/Hg, TOC, Grain Size)
4	SP	SAND, Poorly Graded, fine to medium sand, shell fragments, light brown, damp, no odor		
5				LMR11-46-72 (SVOCs, Total Metals/Hg, TOC, Grain Size)
6	SP	SAND, Poorly Graded, fine to medium grained, dark brown, saturated, no odor, grades to CLAYEY SILT, trace fine sand		
7				LMR11-46-93 (SVOCs, Total Metals/Hg, TOC, Grain Size)

Notes:
Result exceeds PEC
DP - Duplicate
FS - Field split
ID - Identification
in bss - Inches below sediment surface
J - Estimated value
J+ - Estimated value, biased high
J- - Estimated value, biased low
mg/kg - milligram per kilogram
NL - Not Listed
PEC - Probable Effect Concentration
U - Not detected
[1] Consensus-based PEC values (2000)

This document shall not be disclosed without the express written permission of U.S. EPA.

Notes:

µg/kg - Microgram per kilogram
DP - Duplicate
FS - Field split
ID - Identification
in bss - Inches below sediment surface
J - Estimated value
NL - Not Listed
PCB - Polychlorinated biphenyl
PEC - Probable Effect Concentration
U - Not detected
[1] Consensus-based PEC values (2000)
