A full data validation was performed on the analytical data for twenty-two sediment samples collected on June 20, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract

Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOC	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning

- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in one sample due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Semivolatile Organic Compounds (SVOC)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples except the following.

Sample ID	Date Collected	Date Analyzed	# of Days	Qualifier
2-8, 10	06/29/13	08/10/13	42	J/UJ – Unless (R)
12-14	06/29/13	08/11/13	43	J/UJ – Unless (R)
20	06/29/13	08/13/13	45	J/UJ – Unless (R)

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria.

ICAL Date	Compound	%RSD/RRF	Qualifier	Affected Samples
07/29/13	Pentachlorophenol	21.2%	None	See HT
	Pyrene	22.6%	None	

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
08/07/13 (2309)	Pentachlorophenol	26.3%	J/UJ	9, 11
08/08/13 (1021)	Hexachlorocyclopentadiene	69.0%	J/UJ	9, 11
08/08/13 (2311)	Hexachlorocyclopentadiene	75.2%	J/UJ	15-19, 22
08/10/13 (1830)	Indeno(1,2,3-cd)pyrene	39.1%	None	See HT
	Dibenzo(a,h)anthracene	38.1%	None	
	Benzo(g,h,i)perylene	39.0%	None	
08/11/13 (0248)	Hexachlorocyclopentadiene	76.0%	None	See HT
08/14/13 (0115)	Hexachlorocyclopentadiene	59.1%	None	See HT
	Caprolactam	62.5%	None	

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLK10	Bis(2-ethylhexyl)phthalate	20	U	4, 7, 12-14

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values except the following.

Sample ID	Surrogate	%R	Qualifier
3	4-Methylphenol-d8	104%	J - Associated Positive Results
4	4-Methylphenol-d8	102%	None - ND
5	4-Methylphenol-d8	106%	None - ND
6	4-Methylphenol-d8	106%	J - Associated Positive Results
7	4-Methylphenol-d8	111%	None - ND
	4-Chloroaniline-d4	0%	R - Associated Compounds
9	4-Methylphenol-d8	118%	None - ND

Sample ID	Surrogate	%R	Qualifier
10	4-Methylphenol-d8	119%	None - ND
12	4-Methylphenol-d8	129%	None - ND
	Anthracene-d10	99%	J - Associated Positive Results
14	4-Methylphenol-d8	122%	None - ND
15	Phenol-d5	116%	J - Associated Positive Results
	4-Methylphenol-d8	132%	None - ND
	Pyrene-d10	125%	J - Associated Positive Results
16	Phenol-d5	119%	None - ND
	4-Methylphenol-d8	143%	
	Pyrene-d10	133%	J - Associated Positive Results
17	Phenol-d5	111%	None - ND
	4-Methylphenol-d8	127%	
18	4-Methylphenol-d8	117%	None - ND
19	Phenol-d5	121%	None - ND
	4-Methylphenol-d8	126%	
20	Phenol-d5	104%	None - ND
	4-Methylphenol-d8	112%	

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values.

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria except the following.

Sample ID	Internal Standard	Area Count	Qualifier
5	IS5=Chrysene-d12	Low	None - See HT
	IS6=Perylene-d12	Low	
20	IS6=Perylene-d12	Low	None - See HT

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- Several samples were analyzed at various dilutions due to high concentrations of target compounds. No action was required.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

SVOC				
Compound	LMR13-66-024 ug/kg	LMR13-66-024FD ug/kg	RPD	Qualifier
Benzaldehyde	29	33	13%	None
Naphthalene	54	52	4%	
2-Methylnaphthalene	14	11	24%	
Acenaphthylene	15	39	89%	
Acenaphthene	180	210	15%	
Dibenzofuran	24	25	4%	
Fluorene	160	140	13%	
Phenanthrene	1600	1400	13%	
Anthracene	310	310	0%	
Carbazole	230U	16	NC	
Di-n-butylphthalate	230U	9.8	NC	
Fluoranthene	2100	1400	40%	
Pyrene	1400	1500	7%	
Benzo(a)anthracene	760	660	14%	
Chrysene	820	700	16%	
Benzo(b)fluoranthene	770	440	55%	
Benzo(k)fluoranthene	630	440	36%	
Benzo(a)pyrene	730	560	26%	
Indeno(1,2,3-cd)pyrene	320	350	9%	
Dibenzo(a,h)anthracene	120	130	8%	
Benzo(g,h,i)perylene	320	360	12%	

Polynuclear Aromatic Hydrocarbons (PAH 34)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met.

Continuing Calibration

- All %D and RRF criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKO1	Naphthalene	0.47	U	12
	Acenaphthylene	0.19	U	
	Phenanthrene	0.27	None	All >5X
	Fluoranthene	0.68	None	
	Pyrene	0.80	None	
	Benzo(a)anthracene	1.2	None	
	Chrysene	1.1	None	
	Benzo(b)fluoranthene	1.2	None	
	Benzo(k)fluoranthene	1.3	None	
	Benzo(e)pyrene	0.97	None	
	Benzo(a)pyrene	1.9	None	
	Perylene	0.55	None	
	Indeno(1,2,3-cd)pyrene	0.95	None	
	Dibenzo(a,h)anthracene	0.25	None	
	Benzo(g,h,i)perylene	1.2	None	
	C1-Fluoranthenes/Pyrenes	0.76	U	12
	C1 Chyrsenes	0.61	U	
	Total 16 PPAH	12	J	
	Total PAH	14	J	

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- A MS/MSD sample was not analyzed.

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- EDS Sample ID #12 was analyzed at a 6.7X dilution due to high concentrations of target compounds. Several compound concentrations exceeded the linear range of the instrument and were flagged (E) by the laboratory and further qualified as estimated (J).
- Total 16 PPAH and Total PAH were estimated (J) in all samples due to blank contamination.

Field Duplicate Sample Precision

- Field duplicate samples were not analyzed.

Polychlorinated Biphenyls (PCBs)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days.

Initial Calibration

- All %RSD and/or correlation coefficient criteria were met.

Continuing Calibration

- All %D criteria were met.

Method Blank

- The method blanks were free of contamination.

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate recoveries.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD samples exhibited acceptable %R and RPD values.

Laboratory Control Samples

- The LCS sample exhibited acceptable %R values.

Compound Quantitation

- Several samples were analyzed at various dilutions due to high concentrations of target compounds. No action was required.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

PCBs				
Compound	LMR13-69-024 (SDG 200-17122) ug/kg	LMR13-69-024FD ug/kg	RPD	Qualifier
Aroclor-1248	67	64	5%	None
Aroclor-1254	74	59	23%	
Aroclor-1260	14	15	7%	

GC Column Difference Results

- Several samples exhibited high %D values > 25% between columns and have been qualified as estimated (J) by the reviewer.

Metals & Mercury

Holding Times

- All samples were prepared and analyzed within 28 days for mercury and 180 days for all other metals.

ICP/MS Tuning

- Not applicable.

Initial Calibration Verification

- All initial calibration criteria were met.

Continuing Calibration Verification

- All continuing calibration criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
PBS	Zinc	2.2	None	All Associated >10X

Field Blank

- Field QC samples were not analyzed.

ICP Interference Check Sample

- The ICP interference check sample exhibited acceptable %R values.

Laboratory Control Samples

- The LCS sample exhibited acceptable recoveries.

Matrix Spike Analysis

- The matrix spike samples exhibited acceptable %R values.

Duplicate Sample Analysis

- The duplicate samples exhibited acceptable RPD values.

ICP Serial Dilution

- ICP serial dilution percent differences (%D) were within acceptance limits except the following.

ICP Sample ID	Compound	%D	Qualifier	Affected Samples
5	Cadmium	55%	J	All Samples
	Chromium	18%	J	
	Copper	12%	J	
	Nickel	17%	J	
	Zinc	16%	J	

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

Metals				
Compound	LMR13-69-024 (SDG 200-17122) mg/kg	LMR13-69-024FD mg/kg	RPD	Qualifier
Arsenic	7.7	7.3	5%	None
Cadmium	1.1	1.0	10%	
Chromium	28.8	28.1	2%	
Copper	32.5	30.8	5%	
Lead	27.6	25.1	9%	
Nickel	32.1	32.4	1%	
Zinc	133	129	3%	
Mercury	0.13	0.068	63%	

Oil & Grease, Total Organic Carbon, AVS/SEM (Metals & Hg)

Holding Times

- All samples were analyzed within the recommended holding time for each analysis except the following.

TOC				
Sample ID	Date Collected	Date Analyzed	# of Days	Qualifier
All Samples	06/20/13	08/08/13-08/15/13	18-25	J/UJ

Initial and Continuing Calibration

- All %R criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
MB 240-93562/1-A	HEM	120.1	U	12-16, 22

Field Blank

- Field QC samples were not included in this data package.

Laboratory Control Samples

- The LCS samples exhibited acceptable %R values.

Matrix Spike/Duplicate (MS/DUP) Recoveries

- The MS/DUP samples exhibited acceptable %R and RPD values except the following.

MS/DUP ID	Compound	MS %R/MSD %R/RPD	Qualifier	Affected Samples
5	HEM	OK/58/OK	J/UJ	All Samples

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for fifteen sediment samples collected on June 20, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOC	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2

Analysis	*Method References*
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in three samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Semivolatile Organic Compounds (SVOC)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples except the following.

Sample	Date Extracted	Date Analyzed	# of Days	Qualifier
1, 5, 6, 8, 11	06/29/13	08/12/13	44	J/UJ - Unless (R)
3, 12, 13, 14	06/29/13	08/13/13	45	J/UJ - Unless (R)

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met except the following.

ICAL Date	Compound	%RSD/RRF	Qualifier	Affected Samples
07/29/13	Pentachlorophenol	21.2%	J/UJ	7, 9, 10
	Pyrene	22.6%	J/UJ	

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
08/08/13 (1254)	Pyrene	31.3%	None	See ICAL
	Indeno(1,2,3-cd)pyrene	37.8%	J/UJ	7, 9, 10
	Dibenzo(a,h)anthracene	38.9%	J/UJ	
	Benzo(g,h,i)perylene	34.6%	J/UJ	
08/08/13 (2252)	Hexachlorocyclopentadiene	71.5%	J/UJ	7, 9, 10
08/08/13 (2311)	Hexachlorocyclopentadiene	75.2%	J/UJ	2, 4
08/12/13 (1943)	Hexachlorocyclopentadiene	61.2%	None	See HT
08/13/13 (0257)	Hexachlorocyclopentadiene	62.7%	J/UJ	15

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKN9	Naphthalene	29	U	1, 2, 3, 6
	Di-n-butylphthalate	27	U	1, 2, 3, 4, 6
	Benzo(a)anthracene	8.1	U	1, 2, 6, 11, 12, 13-15
	Chrysene	8.7	U	1, 2, 6, 11, 12, 13-15
	Bis(2-ethylhexyl)phthalate	32	U	1, 2, 4, 8
SBLK9N	Naphthalene	24	U	10
	Phenanthrene	5.5	None	All >5X
	Di-n-butylphthalate	18	U	7, 10
	Butylbenzylphthalate	10	None	All ND
	Bis(2-ethylhexyl)phthalate	28	U	7

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values except the following.

Sample ID	Surrogate	%R	Qualifier
1	Phenol-d5	105%	J - Associated Positive Compounds
	4-Methylphenol-d8	121%	None - ND
	4-Chloroaniline-d4	0%	R - Associated Compounds
	Pyrene-d10	141%	None - ND
3	Phenol-d5	113%	None - ND
	4-Methylphenol-d8	128%	None - ND
	Acenaphthylene-d8	100%	J - Associated Positive Compounds
5	4-Chloroaniline-d4	0%D	None - 50X Dilution
	4-Nitrophenol-d4	0%D	
6	Phenol-d5	110%	J - Associated Positive Compounds
	4-Methylphenol-d8	129%	None - ND
	4-Chloroaniline-d4	0%	R - Associated Compounds
	Pyrene-d10	39%	J - Associated Positive Compounds

Sample ID	Surrogate	%R	Qualifier
7	4-Methylphenol-d8	107%	None - ND
8	4-Methylphenol-d8	101%	None - ND
9	Several Surrogates	High/Low	None - 500X Dilution
10	4-Methylphenol-d8	107%	None - ND
	4-Chloroaniline-d4	0%	R - Associated Compounds
11	Several Surrogates	High/Low	None - 1428X Dilution
12	Several Surrogates	High/Low	None - 666X Dilution
13	Several Surrogates	High/Low	None - 1250X Dilution
14	Several Surrogates	High/Low	None - 100X Dilution
15	Several Surrogates	High/Low	None - 666X Dilution

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values except the following.

MS/MSD Sample ID	Compound	MS %R/MSD %R/ RPD	Qualifier
9	Several Compounds	High/Low	None - 500X Dilution

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- Several samples were analyzed at various dilutions due to high concentrations of target compounds. No action was required.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

SVOC				
Compound	LMR13-95-024 ug/kg	LMR13-95-024FD ug/kg	RPD	Qualifier
Naphthalene	12000000	8400000	35%	None
2-Methylnaphthalene	1200000	780000	42%	
1,1'-Biphenyl	240000	150000	46%	
Acenaphthylene	840000	600000	33%	
Acenaphthene	130000	98000	28%	
Dibenzofuran	800000	520000	42%	
Fluorene	1100000	740000	39%	
Phenanthrene	3400000	2300000	39%	
Anthracene	1100000	760000	37%	
Carbazole	320000	220000	37%	
Fluoranthene	2200000	1500000	38%	
Pyrene	1600000	1100000	37%	
Benzo(b)fluoranthene	510000	270000	62%	
Benzo(k)fluoranthene	510000	370000	32%	
Benzo(a)pyrene	590000	400000	38%	
Indeno(1,2,3-cd)pyrene	270000	210000	25%	
Dibenzo(a,h)anthracene	1500000U	89000	NC	
Benzo(g,h,i)perylene	250000	200000	22%	

Polynuclear Aromatic Hydrocarbons (PAH 34)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples except the following.

Sample	Date Extracted	Date Analyzed	# of Days	Qualifier
9	06/29/13	08/14/13	46	J/UJ

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met.

Continuing Calibration

- All %D and RRF criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKN9	Naphthalene	21	U	6
	1-Methylnaphthalene	0.83	U	6
	2-Methylnaphthalene	1.8	U	6
	Acenaphthylene	2.5	U	6
	Acenaphthene	0.23	None	All >5X
	Fluorene	1.3	None	All >5X
	Phenanthrene	4.4	None	All >5X
	Anthracene	1.3	None	All >5X
	Fluoranthene	2.9	None	All >5X
	Pyrene	2.3	None	All >5X
	Benzo(a)anthracene	1.4	None	All >5X
	Chrysene	1.1	None	All >5X
	Benzo(b)fluoranthene	1.1	None	All >5X
	Benzo(k)fluoranthene	1.1	None	All >5X
	Benzo(e)pyrene	0.92	None	All >5X
	Benzo(a)pyrene	1.6	None	All >5X
	Perylene	0.44	None	All >5X

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKN9 (Cont.)	Indeno(1,2,3-cd)pyrene	0.72	None	All >5X
	Dibenzo(a,h)anthracene	0.18	U	6, 9
	Benzo(g,h,i)perylene	0.90	None	All >5X
	C1 Naphthalenes	2.3	U	6, 7, 9
	C2 Naphthalenes	1.5	U	6, 7, 9
	C1 Phenanthrenes/Anthracenes	1.0	U	6, 7, 9
	C2 Phenanthrenes/Anthracenes	0.36	U	6, 7, 9
	C1 Fluoranthenes/Pyrenes	1.3	U	6, 7, 9
	C1 Chrysenes	0.54	U	6, 7, 9
	Total 16 PPAH	0.95	J	6, 7, 9
	Total PAH	0.95	J	

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values except the following.

MS/MSD Sample ID	Compound	MS %R/MSD %R/ RPD	Qualifier
9	Several Compounds	High/Low	None - 3333.3X Dilution

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- EDS Sample ID #s 7 and 9 exhibited high concentrations of several target compounds and were flagged (E) by the laboratory. These samples were not reanalyzed and these results were qualified as estimated (J).
- Total 16 PPAH and Total PAH were estimated (J) in all samples due to blank contamination.

Field Duplicate Sample Precision

- Field duplicate samples were not analyzed.

Polychlorinated Biphenyls (PCBs)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days.

Initial Calibration

- All %RSD and/or correlation coefficient criteria were met.

Continuing Calibration

- All %D criteria were met.

Method Blank

- The method blanks were free of contamination.

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate recoveries.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD samples exhibited acceptable %R and RPD values.

Laboratory Control Samples

- The LCS sample exhibited acceptable %R values.

Compound Quantitation

- Several samples were analyzed at various dilutions due to high concentrations of target compounds. No action was required.

Field Duplicate Sample Precision

- Field duplicate samples were not analyzed.

GC Column Difference Results

- Several samples exhibited high %D values > 25% between columns and have been qualified as estimated (J) by the reviewer.

Metals & Mercury

Holding Times

- All samples were prepared and analyzed within 28 days for mercury and 180 days for all other metals.

ICP/MS Tuning

- Not applicable.

Initial Calibration Verification

- All initial calibration criteria were met.

Continuing Calibration Verification

- All continuing calibration criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
MB	Zinc	0.39	None	All Associated >10X

Field Blank

- Field QC samples were not analyzed.

ICP Interference Check Sample

- The ICP interference check sample exhibited acceptable %R values.

Laboratory Control Samples

- The LCS sample exhibited acceptable recoveries.

Matrix Spike/Duplicate (MS/DUP) Analysis

- The MS/DUP samples exhibited acceptable %R and RPD values except the following.

MS/DUP Sample ID	Compound	MS %R/RPD	Qualifier	Affected Samples
13	Zinc	138%/Ok	None	See ICP SD
	Mercury	59%/94	J/UJ	All Samples

ICP Serial Dilution

- ICP serial dilution percent differences (%D) were within acceptance limits except the following.

ICP Sample ID	Compound	%D	Qualifier	Affected Samples
13	Arsenic	16%	J	All Samples
	Chromium	20%	J	
	Copper	18%	J	
	Lead	13%	J	
	Nickel	25%	J	
	Zinc	20%	J	

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate samples were not analyzed.

Oil & Grease, Total Organic Carbon, AVS/SEM (Metals & Hg)

Holding Times

- All samples were analyzed within the recommended holding time for each analysis except the following.

TOC				
Sample ID	Date Collected	Date Analyzed	# of Days	Qualifier
All Samples	06/20/13	07/22/13 or 08/15/13	32 or 55	J/UJ

Initial and Continuing Calibration

- All %R criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
240-93562/1-A	HEM	120.1	U	10

Field Blank

- Field QC samples were not included in this data package.

Laboratory Control Samples

- The LCS samples exhibited acceptable %R values.

Matrix Spike/Duplicate (MS/DUP) Recoveries

- The MS/DUP samples exhibited acceptable %R and RPD values except the following.

MS/DUP ID	Compound	MS %R/MSD %R/RPD	Qualifier	Affected Samples
13	HEM	227%/169%/OK	None	4X Rule Applies

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

HEM				
Compound	LMR13-95-024 mg/kg	LMR13-95-024FD mg/kg	RPD	Qualifier
HEM	39500	48000	19%	None

Data Qualifiers

U = The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

UJ = The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).

J+ = The result is an estimated quantity, but the result may be biased high.

J- = The result is an estimated quantity, but the result may be biased low.

R = The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

NJ = The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

A full data validation was performed on the analytical data for sixteen sediment samples collected on June 20, 2013 by EA Engineering at the Lower Maumee River site in Toledo, Ohio. The samples were analyzed under the Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) Multi-Media Multi-Concentration Organics Analysis SOM01.2 and Inorganic Analysis ILM05.4 and the Test Methods for the Evaluation of Solid Waste, USEPA SW-846, Third Edition, September 1986, with revisions.

Specific method references are as follows:

Analysis	*Method References*
SVOC	USEPA CLP SOM01.2
PAH 34	USEPA CLP SOM01.2
PCBs	USEPA CLP SOM01.2
Michigan Metals & Mercury	USEPA CLP ISM01.3
AVS/SEM	USEPA SW-846 Methods 6010C/7470A
TOC	Lloyd Kahn
Oil & Grease (HEM)	USEPA SW-846 Method 9071B

The data have been validated according to the protocols and quality control (QC) requirements of the analytical methods, the Great Lakes Legacy Act, March 2010, the Quality Assurance Project Plan for Phase 2 of the Lower Maumee River Site Characterization, May 2013, and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," June 2008;
- The USEPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review," January 2010;
- and the reviewer's professional judgment.

The following items/criteria were reviewed for this report:

Organics

- Holding times and sample preservation
- Gas Chromatography/Mass Spectroscopy (GC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample (LCS) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Tentatively Identified Compounds (TICs)
- Field Duplicate sample precision

Inorganics

- Holding times and sample preservation
- ICP/MS Tuning
- Initial and continuing calibration verifications
- Method blank and field blank contamination
- ICP Interference Check Sample
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike Analysis
- Duplicate Sample Analysis
- ICP Serial Dilution
- Compound Quantitation
- Field Duplicate sample precision

Overall Usability Issues:

There were minor rejections of data. This data cannot be used in the decision-making process for this project.

- Three SVOC compounds were rejected in eleven samples due to severely low surrogate recoveries.

Overall the remaining data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Semivolatile Organic Compounds (SVOC)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples. Except the following.

Sample ID	Date Collected	Date Analyzed	# of Days	Qualifier
1, 2, 5-7, 9, 11-16	07/01/13	08/18/13	48	J/UJ Unless (R)
3, 8	07/01/13	08/14/13	44	J/UJ Unless (R)

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met except the following.

ICAL Date	Compound	%RSD/RRF	Qualifier	Affected Samples
08/02/13	Benzo(b)fluoranthene	23.7%	None	See HT
	Dibenzo(a,h)anthracene	20.6%	None	

Continuing Calibration

- All %D and RRF criteria were met except the following.

CCAL Date	Compound	%D/RRF	Qualifier	Affected Samples
08/14/13 (1833)	Hexachlorocyclopentadiene	74.9%	None	See Surrogates
08/18/13 (1354)	2-Methylnaphthalene	38.5%	None	See Surrogates
08/18/13 (2319)	Di-n-octylphthalate	73.1%	None	See Surrogates
	Hexachlorocyclopentadiene	70.9%	None	

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKO2	Phenol	4.0	U	1, 2
	Di-n-butylphthalate	8.1	U	1, 2, 5-7, 9, 11-16
	Butylbenzylphthalate	15	U	1, 2, 5-7, 12, 14, 16
	Bis(2-ethylhexyl)phthalate	27	U	5, 7, 12, 14-16
SBLK2O	Bis(2-ethylhexyl)phthalate	39	U	8

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values except the following.

Sample ID	Surrogate	%R	Qualifier
1	Phenol-d5	108%	None - See HT
	4-Methylphenol-d8	111%	
	4-Chloroaniline-d4	0%	R – Associated Compounds
2	Phenol-d5	123%	None - See HT
	4-Methylphenol-d8	110%	
	4-Chloroaniline-d4	0%	R – Associated Compounds

Sample ID	Surrogate	%R	Qualifier
3	4-Chloroaniline-d4	0%	R – Associated Compounds
5	Phenol-d5	118%	None - See HT
	4-Methylphenol-d8	107%	
	4-Chloroaniline-d4	0%	R – Associated Compounds
6	Phenol-d5	113%	None - See HT
	4-Methylphenol-d8	112%	
	2,4-Dichlorophenol-d3	17%	
7	Phenol-d5	119%	None - See HT
	4-Chloroaniline-d4	0%	R – Associated Compounds
8	Phenol-d5	109%	None - See HT
	4-Methylphenol-d8	103%	
	Nitrobenzene-d5	106%	
	2-Nitrophenol-d4	106%	
	4-Chloroaniline	0%	R – Associated Compounds
	Pyrene-d10	132%	None - See HT
9	Phenol-d5	117%	None - See HT
	4-Methylphenol-d8	103%	
	4-Chloroaniline-d4	0%	R – Associated Compounds
11	Phenol-d5	123%	None - See HT
	4-Methylphenol-d8	110%	
	2,4-Dichlorophenol-d3	18%	
	Pyrene-d10	122%	
12	Phenol-d5	120%	None - See HT
	4-Methylphenol-d8	102%	
	2,4-Dichlorophenol-d3	14%	
	4-Chloroaniline-d4	0%	R – Associated Compounds
13	4-Chloroaniline-d4	0%	R – Associated Compounds
14	Phenol-d5	115%	None - See HT
15	Phenol-d5	123%	None - See HT
	4-Methylphenol-d8	112%	
	4-Chloroaniline-d4	0%	R – Associated Compounds
16	4-Chloroaniline-d4	0%	R – Associated Compounds

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD sample exhibited acceptable %R and RPD values.

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- Several samples were analyzed at various dilutions due to high concentrations of target compounds. No action was required.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

SVOC				
Compound	LMR13-52-024 ug/kg	LMR13-52-024FD ug/kg	RPD	Qualifier
Benzaldehyde	50	26	63%	None
Acetophenone	26	230U	NC	
Naphthalene	88	48	59%	
2-Methylnaphthalene	68	31	75%	
Dimethylphthalate	300U	130	NC	
1,1'-Biphenyl	14	230U	NC	
Acenaphthylene	44	24	59%	
Acenaphthene	100	73	31%	
Dibenzofuran	65	38	52%	
Fluorene	140	91	42%	
Phenanthrene	610	620	2%	
Anthracene	160	150	6%	
Carbazole	31	38	20%	
Fluoranthene	1100	1000	10%	
Pyrene	1300	990	27%	
Benzo(a)anthracene	800	560	35%	
Chrysene	790	630	23%	
Bis(2-ethylhexyl)phthalate	470	230U	NC	
Benzo(b)fluoranthene	630	510	21%	
Benzo(k)fluoranthene	560	390	36%	
Benzo(a)pyrene	610	480	24%	
Indeno(1,2,3-cd)pyrene	370	250	39%	
Dibenzo(a,h)anthracene	130	84	43%	
Benzo(g,h,i)perylene	360	280	25%	

Polynuclear Aromatic Hydrocarbons (PAH 34)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days for all samples.

GC/MS Tuning

- All criteria were met.

Initial Calibration

- All %RSD and mean RRF criteria were met.

Continuing Calibration

- All %D and RRF criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. ug/kg	Qualifier	Affected Samples
SBLKO2	Naphthalene	0.21	None	All >5X
	Phenanthrene	0.20	None	
	Fluoranthene	0.17	None	
	Pyrene	0.12	None	
	Benzo(a)anthracene	0.12	None	
	Chrysene	0.10	None	
	Benzo(b)fluoranthene	0.091	None	
	Benzo(k)fluoranthene	0.083	None	
	Total 16 PPAH	1.1	J	1
	Total PAH	1.1	J	

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- A MS/MSD sample was not analyzed.

Laboratory Control Samples

- A LCS sample was not analyzed.

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- EDS Sample ID #1 was analyzed at a 3.3X dilution due to high concentrations of target compounds. Several compound concentrations exceeded the linear range of the instrument and were flagged (E) by the laboratory and further qualified as estimated (J).
- Total 16 PPAH and Total PAH were estimated (J) in all samples due to blank contamination.

Field Duplicate Sample Precision

- Field duplicate samples were not analyzed.

Polychlorinated Biphenyls (PCBs)

Holding Times

- All samples were extracted within 14 days for sediment samples and analyzed within 40 days.

Initial Calibration

- All %RSD and/or correlation coefficient criteria were met.

Continuing Calibration

- All %D criteria were met.

Method Blank

- The method blanks were free of contamination.

Field Blank

- Field QC samples were not analyzed.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate recoveries.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- A MS/MSD sample was not analyzed.

Laboratory Control Samples

- The LCS sample exhibited acceptable %R values.

Compound Quantitation

- Several samples were analyzed at various dilutions due to high concentrations of target compounds. No action was required.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

PCBs				
Compound	LMR13-80-024 ug/kg	LMR13-80-024FD ug/kg	RPD	Qualifier
None	ND	ND	-	-

PCBs				
Compound	LMR13-53-024 ug/kg	LMR13-53-024FD ug/kg	RPD	Qualifier
Aroclor-1248	200	160	22%	None
Aroclor-1254	260	170	42%	
Aroclor-1260	61	52	16%	

GC Column Difference Results

- Several samples exhibited high %D values > 25% between columns and have been qualified as estimated (J) by the reviewer.

Metals & Mercury

Holding Times

- All samples were prepared and analyzed within 28 days for mercury and 180 days for all other metals.

ICP/MS Tuning

- Not applicable.

Initial Calibration Verification

- All initial calibration criteria were met.

Continuing Calibration Verification

- All continuing calibration criteria were met.

Method Blank

- The method blanks exhibited the following contamination.

Blank ID	Compound	Conc. mg/kg	Qualifier	Affected Samples
MB	Chromium	0.092	None	All Associated >10X
	Zinc	0.27	None	

Field Blank

- Field QC samples were not analyzed.

ICP Interference Check Sample

- The ICP interference check sample exhibited acceptable %R values.

Laboratory Control Samples

- The LCS sample exhibited acceptable recoveries.

Matrix Spike Analysis

- The matrix spike samples exhibited acceptable %R values.

Duplicate Sample Analysis

- The duplicate samples exhibited acceptable RPD values.

ICP Serial Dilution

- ICP serial dilution percent differences (%D) were within acceptance limits except the following.

ICP Sample ID	Compound	%D	Qualifier	Affected Samples
1	Chromium	16%	J	All Samples
	Copper	12%	J	
	Nickel	19%	J	
	Zinc	17%	J	

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below.

Metals				
Compound	LMR13-80-024 mg/kg	LMR13-80-024FD mg/kg	RPD	Qualifier
Arsenic	16.4	14.9	10%	None

Data Qualifiers

U	=	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.
UJ	=	The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.
J	=	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).
J+	=	The result is an estimated quantity, but the result may be biased high.
J-	=	The result is an estimated quantity, but the result may be biased low.
R	=	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
NJ	=	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

Dear Mr. Loomis:

EPA CONTRACT NUMBER EP-W-10-033
TASK ORDER NUMBER 2125
DATA VALIDATION SUPPORT

Enclosed please find the Summary of Qualifier Changes for the validation of Total Organic Carbon (TOC), Hexane Extractable Material (HEM), Metals, Mercury, Acid Volatile Sulfide (AVS), Simultaneously Extracted Metals (SEM), Semivolatile, Semivolatile SIM, Aroclors, and Geotechnical Methods sediment sample data for the Lower Maumee River, Phase 2 Characterization site in Toledo, Ohio analyzed by TestAmerica Laboratories, in Burlington, Vermont; North Canton, Ohio; and Pittsburgh, Pennsylvania. This report is a deliverable under Task 3 of the subject Task Order.

If you have any questions, please feel free to contact me.

Sincerely,

Shellee McGrath

RELEASE OF VALIDATED DATA

DATE: December 10, 2013

SUBJECT: Review of Data for Phase 2 of the Lower Maumee River Site Characterization
Received for Review: November 5, 2013, November 20, 2013,
and December 5, 2013

LABORATORY: TestAmerica Laboratories, Burlington, Vermont; North Canton, Ohio; and Pittsburgh, Pennsylvania

FROM: Shellee McGrath, CB&I Federal Services, LLC
Quality Assurance Technical Support (QATS) Program, Las Vegas, NV

TO: Mark Loomis, Great Lakes National Program Office (GLNPO)

LEVEL OF REVIEW: Tier 2 Validation Review

QATS has completed review of the validated data for the following project:

SITE Name: Lower Maumee River, Phase 2 Site Characterization, Toledo, Ohio

Contractor: EA Engineering, Science, and Technology, Inc., Hunt Valley, Maryland

Primary Validators: Environmental Data Services, Inc. Williamsburg, Virginia

SDG Numbers: J16948, J16995, J16999, J17010, J17014, J17024, J17028, J17052, J17054 J17055, J17056, J17061, J17071, J17078, J17083, J17096, J17099, J17122 J17125, J17127, and J17149

Number and Type of Samples: 409 Sediment Samples

Case Number: NA SDG Number: 21 Various
Site Name: Lower Maumee River Laboratory: TestAmerica Laboratories

VALIDATION SUMMARY

Introduction: This report summarizes the data verification of previously validated analytical results from samples from the Lower Maumee River, Phase 2 Characterization site, in support of EPA's Great Lakes National Program Office (GLNPO). This evaluation and preparation of this report was performed by CB&I's Quality Assurance Technical Support Program (QATS) under Technical Direction 04, Task Order 2125.

Four hundred and nine (409) sediment samples in 21 SDGs (SDGs J16948, J16995, J16999, J17010, J17014, J17024, J17028, J17052, J17054, J17055, J17056, J17061, J17071, J17078, J17083, J17096, J17099, J17122, J17125, J17127, and J17149) were collected by EA Engineering, Science, and Technology, Inc. (EA) from the Lower Maumee River site locations between June 11, 2013 and June 20, 2013 and shipped to TestAmerica Laboratories in Burlington, Vermont and North Canton, Ohio for analysis. The samples designated for Hexane Extractable Material (HEM) analysis from SDGs J17052, J17054, J17056, J17061, and J17078 were subsequently shipped from the North Canton, Ohio laboratory to the TestAmerica Laboratory in Pittsburgh, Pennsylvania for analysis.

The TestAmerica Laboratory in Burlington, Vermont analyzed the samples for Total Organic Carbon (TOC), Metals, Mercury, Acid Volatile Sulfide (AVS), Simultaneously Extracted Metals (SEM), Semivolatile, Semivolatile SIM, Aroclors, and Geotechnical Methods. TestAmerica Laboratories in North Canton, Ohio and Pittsburgh, Pennsylvania analyzed the samples for HEM. Environmental Data Services, Inc. (EDS) in Williamsburg, Virginia performed an initial full validation on all samples between August 6, 2013 and September 29, 2013. The organic fractions were validated by EDS and validated/verified by QATS in accordance with the National Functional Guidelines (NFG) for Superfund Organic Methods Data Review, June 2008, and the inorganic parameters by the National Functional Guidelines (NFG) for Superfund Inorganic Methods Data Review, January 2010.

Data Verification: At the direction of EPA, the validated data and Electronic Data Deliverable (EDD) files were sent by EA to QATS on November 5, 2013 for a data validation/verification check. Missing data were requested by QATS and subsequently received, including missing ICP-AES data received on November 20, 2013 and a missing reanalyzed PAH sample Form 1 and EDD received on December 5, 2013. Since a full validation had previously been performed by EDS, QATS conducted a Tier 2 validation check (without the full validation reports) on all SDGs using the Tier 2 Validation Worksheets developed by QATS specifically for GLNPO validation. The resulting QATS qualifiers were compared to the EDS-applied qualifiers and verified in the EDD files included with the data submission.

Data validation of the HEM samples revealed a discrepancy in the project holding time requirements. The holding time required by the Quality Assurance Project Plan Phase 2 of the Lower Maumee River Site Characterization is 14 days from collection to extraction and 40 days to analysis. The North Canton, Ohio TestAmercia Laboratory Standard Operating Procedure (SOP) number NC-WC-091 for HEM/SGT-HEM for Methods 1664A, 9070A, and 9071B defines the holding time as 28 days from collection to analysis. Method 9071B, n-Hexane Extractable Material (HEM) for Sludge, Sediment, and Solid Samples recommends that the samples be analyzed as soon as possible. QATS validated the HEM samples using the 14-day Lower Maumee QAPP holding time, resulting in the qualification of 167 HEM sample results.

In the metals fraction, the EDS validators qualified sample results when the associated serial dilution percent differences (%D) exceeded 10%. The Inorganic Superfund Methods NFG allows

for an expanded %D criterion of 15% D for solid and sediment samples. Because the EDS validators appeared to use the expanded RPD criteria of 35% when evaluating the laboratory duplicate samples, QATS validated the serial dilution samples using the expanded criteria allowed in the NFG. This resulted in the removal of 323 J qualifiers from affected metals results for associated serial dilution %Ds that were greater than 10% but less than 15%.

In the PAH fraction, the EDS validators qualified all sample results associated with the deuterated monitoring compound (DMC) 4-chloroaniline-d4 (4CA) as rejected R when the recovery of 4CA was listed as zero (0) on the FORM II DMC report form. The three compounds affected were 4-chloroaniline, hexachlorocyclopentadiene, and 3,3'-dichlorobenzidine. However, since the acceptable %R range for this DMC is 1-145%, an R qualification for the three identified compounds is considered too severe based on the 0% recovery for 4CA. The QATS validators changed the qualifiers for these compounds in 148 samples from R rejected to UJ estimated because the lower acceptable limit for this DMC is so low. The semivolatiles fraction of the organic NFG states, "for %R < Lower Acceptance Limit, qualify non-detected associated compounds UJ or R."

Two closing continuing calibration verification (CCV) standards for the PAH fraction were analyzed by the laboratory at the end of every 12-hour sequence. The project method (SOM01.2) and QAPP (EA Project No. 62561.10, Revision 0, March 2013) both state that this is an acceptable practice. It appears that the EDS validators qualified the sample data results using the closing CCV that had the higher number of compounds not meeting QC criteria (worst case scenario). Since it is an acceptable practice to analyze two closing CCVs, the QATS validators qualified the sample data results using whichever closing CCV had the fewest number of compounds failing QC criteria. As a result, the qualifiers for 66 results from 61 samples were removed.

Results: Data validation verification was performed on all 2,603 analyses, totaling 54,420 results, 49,433 are analytical sample results and 4,987 are QC results (MB and LCS) from the 409 project samples. Of the 49,433 analytical results, 47,914 originally validated analytical results and qualifiers were verified to be correct. Revisions were required for 1,519 of the 49,433 result qualifiers (3.1%). The revisions made by the QATS validators included changing, adding, or removing select qualifiers from the validated data or changing the YES to NO (or vice versa) in the reportable result column.

A summary of the QATS-revised data qualifiers by SDG and fraction was prepared and is presented in tabular form in the next 26 pages of this report. Changes to the qualifiers were also applied to the Region 5 EDD file. Changes to the EDD file that accompany this report are highlighted in blue.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
16948 METALS	Chromium	J	None	LMR13-05-012 LMR13-09-012 LMR13-10-012 LMR13-17-012 LMR13-23-012 LMR13-06-012 LMR13-18-012 LMR13-19-012 LMR13-19-012FD LMR13-20-012 LMR13-02-012 LMR13-02-012FD LMR13-11-012 LMR13-12-012 LMR13-16-012 LMR13-24-012	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
16948 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-12-012 LMR13-18-012 LMR13-19-012 LMR13-20-012	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
16948 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-09-012 LMR13-17-012 LMR13-06-012 LMR13-19-012	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
16948 OIL AND GREASE	HEM	J UJ	None U	LMR13-20-012 LMR13-20-012FD	The original validators did not use the actual field duplicate (FD) value of 402 mg/kg for this sample to calculate the HEM %RPD for LMR13-20-012 field duplicate analysis; instead they compared a non-detected value assigned due to blank contamination which resulted in an RPD of 200%. Since the 402 mg/kg value is over the CRQL of 200 mg/kg, QATS used this value to calculate an RPD of 43.4%. The J qualifier for LMR13-20-012 and the J added to the U qualifier for LMR13-20-012FD were removed.
16995 METALS	Cadmium Chromium Zinc	J	None	LMR13-42-012 LMR13-42-024 LMR13-42-048 LMR13-42-072 LMR13-42-096 LMR13-43-012 LMR13-43-024 LMR13-43-024FD LMR13-43-048 LMR13-43-096 LMR13-44-012	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
16995 METALS	Copper	J	None	LMR13-42-120 LMR13-43-072	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
				LMR13-43-120 LMR13-44-024 LMR13-44-048 LMR13-44-048FD	NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
16995 AROCLOR	Aroclor-1254	None	J	LMR13-43-024FD	The original validators did not qualify the Aroclor-1254 result for the DCB failure due to the 5x dilution. The result was J-qualified by QATS due to the low dilution factor and DCB %R failure in the original analysis.
16995 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-42-024 LMR13-42-024FD LMR13-43-096 LMR13-43-120	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
16995 PAH	Hexachlorocyclopentadiene	U	UJ	LMR13-42-096 LMR13-43-024 LMR13-43-048 LMR13-43-120 LMR13-44-024FD	The original validators did not qualify all of the associated samples for the hexachlorocyclopentadiene closing CCV %D failure.
16995 PAH	Anthracene Phenanthrene	None	J	LMR13-42-096	Four DMC percent recoveries for sample LMR13-42-096 exceeded the upper control limits. The sample was analyzed at a 2.5x dilution. Detected results were qualified J due to the high percent recoveries.
16995 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-44-024 LMR13-44-048	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
16995 OIL AND GREASE	HEM	U	J	LMR13-44-024 LMR13-44-024FD	Trace levels of HEM were detected in two of the three method blanks. The original validators incorrectly qualified two samples in the batch that was associated with the clean blank. The U qualifiers were removed from the two samples and the results returned to the original value with the original J qualifier.
16999 METALS	Copper	J	None	LMR13-44-072 LMR13-44-096 LMR13-46-012 LMR13-46-024 LMR13-46-048 LMR13-46-072 LMR13-46-096 LMR13-46-120 LMR13-81-012 LMR13-81-024 LMR13-81-048 LMR13-81-072 LMR13-81-096 LMR13-81-120	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
16999 MERCURY	Mercury	J	U	LMR13-44-072 LMR13-44-096	Trace level of mercury between the MDL and CRQL was detected in the CCB. The original validation did not report or qualify for the

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
					calibration blank contamination. The results for two samples have been adjusted to the CRQL and qualified "U".
16999 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-44-072 LMR13-44-096	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
16999 PAH	Pentachlorophenol	U	UJ	LMR13-46-120	The original validators did not report or qualify the associated sample for the pentachlorophenol closing CCV %D failure.
16999 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-81-012FD	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
16999 PAH SIM	Fluorene Anthracene Benzo(b)fluoranthene Benzo(k)fluoranthene Benzo(e)pyrene Perylene Indeno (1,2,3-cd)pyrene Benzo(g,h,i)perylene	None	J	LMR13-81-012	The dilution for LMR13-81-012 was analyzed 41 days after extraction, which exceeds the analysis holding time by 1 day. Compounds reported from the diluted sample were qualified J.
16999 PAH SIM	Fluorene Acenaphthene Anthracene Benzo(b)fluoranthene Benzo(k)fluoranthene Benzo(e)pyrene Benzo(a)pyrene Perylene Indeno (1,2,3-cd)pyrene Benzo(g,h,i)perylene	None	J	LMR13-81-012FD	The dilution for LMR13-81-012FD was analyzed 41 days after extraction, which exceeds the analysis holding time by 1 day. Compounds reported from the diluted sample were qualified J.
17010 METALS	Copper	J	None	LMR13-93-012 LMR13-93-024 LMR13-93-048 LMR13-93-072 LMR13-93-096 LMR13-93-120 LMR13-62-024FD LMR13-90-024FD LMR13-62-024 LMR13-90-012 LMR13-90-024 LMR13-90-048 LMR13-90-072 LMR13-62-012 LMR13-62-048 LMR13-62-072	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).

	Benzo(a)pyrene Perylene				
17010 PAH SIM	Naphthalene C1 Naphthalenes C1 Fluorenes	U	UJ	LMR13-90-012FD	The sample was analyzed 41 days after extraction, which exceeds the analysis holding time by 1 day. Non-detected compounds reported from this sample were qualified UJ.
17010 OIL AND GREASE	HEM	U	UJ	LMR13-62-072 LMR13-91-024 LMR13-91-048 LMR13-91-012 LMR13-91-024FD	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The non-detect samples were qualified UJ.
17010 OIL AND GREASE	HEM	None	J	LMR13-47-012 LMR13-90-048FD LMR13-93-024FD	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The detect samples were qualified J.
17014 METALS	Cadmium	J	UJ	LMR13-51-024FD LMR13-51-024 LMR13-51-048 LMR13-51-072	Trace levels of cadmium between the MDL and CRQL were detected in the ICB and CCBs. The original validation did not report or qualify for this calibration blank contamination. The results for four samples have been adjusted to the CRQL and qualified U. The J is added for the serial dilution exceeding criteria.
17014 MERCURY	Mercury	J	U	LMR13-47-024 LMR13-47-048 LMR13-47-096 LMR13-51-048	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCBs. The original validation did not report or qualify for this calibration blank contamination. The results for four samples have been adjusted to the CRQL and qualified U.
17014 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-91-072 LMR13-91-096 LMR13-47-024 LMR13-47-048 LMR13-47-072 LMR13-47-096 LMR13-63-012 LMR13-63-024 LMR13-63-048 LMR13-63-072 LMR13-63-096 LMR13-51-012 LMR13-51-024 LMR13-51-048 LMR13-63-024FD LMR13-51-012FD	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17014 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-47-120 LMR13-63-024 LMR13-63-048	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17014 PAH	Hexachlorobutadiene	U	UJ	LMR13-91-072 LMR13-63-096	The original validators did not report or qualify the associated samples for the hexachlorobutadiene closing CCV %D failure.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17014 PAH	Pyrene	None	J	LMR13-91-072	The original validators did not report or qualify the associated sample results for the Pyrene-d_{10} low DMC percent recovery.
17014 OIL AND GREASE	HEM	None	J	LMR13-91-072 LMR13-91-096 LMR13-47-024 LMR13-47-048 LMR13-47-072 LMR13-47-096	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were qualified J.
17024 MERCURY	Mercury	None	J	LMR13-45-024FD	The original validator did not qualify mercury for a field duplicate RPD > 100%. A J qualifier was assigned.
17024 AROCLOR	Aroclor-1248	None	J	LMR13-45-048 LMR13-45-072	The original validator did not qualify for four CCV failures. Several results are already qualified J for other reasons. The QATS validator added a J qualifier to two samples.
17024 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-45-012 LMR13-45-024RE LMR13-45-048 LMR13-49-048 LMR13-83-024 LMR13-50-024FD LMR13-83-024FD	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17024 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-50-096 LMR13-50-120	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17024 PAH	1,2,4,5-Tetrachlorobenzene	UJ	U	LMR13-45-048 LMR13-45-072RE LMR13-45-120	Internal standard Phenanthrene-d10 exceeded criteria and associated compounds were qualified. 1,2,4,5-tetrachlorobenzene was incorrectly included in the qualified compounds. The J was removed from the UJ qualifier by the QATS validator.
17024 PAH	2,4-Dinitrophenol	UJ	U	LMR13-49-024 LMR13-49-048 LMR13-49-072 LMR13-50-120 LMR13-49-096 LMR13-49-120 LMR13-83-012 LMR13-83-024	The original validators qualified 2,4-Dinitrophenol UJ due to a closing CCV failure. The laboratory analyzed two closing CCVs. 2,4-dinitrophenol was within criteria in the first CCV and out in the second CCV (50.2 %D). The J was removed from the UJ qualifier by the QATS validators due to the passing %D in the first CCV.
17028 METALS	Chromium Zinc	J	None	LMR13-83-048 LMR13-83-072 LMR13-41-012 LMR13-41-024 LMR13-41-024FD LMR13-41-048 LMR13-57-012 LMR13-26-012 LMR13-26-012FD	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
				LMR13-57-024 LMR13-57-048 LMR13-72-048 LMR13-27-012 LMR13-27-024 LMR13-27-024FD LMR13-27-048 LMR13-27-072 LMR13-72-012 LMR13-72-024 LMR13-72-024FD LMR13-72-096 LMR13-27-096 LMR13-72-072	
17028 MERCURY	Mercury	U	J	LMR13-26-012FD LMR13-57-048 LMR13-27-012 LMR13-27-072 LMR13-72-012	Trace levels of mercury were detected in one method blank. The original validators incorrectly qualified five samples that were in the batch associated with the clean blank. The U qualifiers were removed from the five samples and the results returned to the original value with the original J qualifier. Note that the original results for LMR13-27-072 and LMR13-72-012 were detects. A J qualifier was applied to those samples for failed matrix spike percent recovery.
17028 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-83-048 LMR13-41-012 LMR13-41-048 LMR13-26-012 LMR13-26-012FD LMR13-27-048 LMR13-27-072 LMR13-72-012 LMR13-27-096 LMR13-72-072	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17028 PAH	2-Methylphenol 4-Methlyphenol 2,4-Dimethylphenol	R	UJ	LMR13-83-048 LMR13-27-096	The R qualifier that was applied for the DMC recovery of 2% for 4-Methlyphenol-d_8 was replaced with a UJ because the lower acceptance criterion is 8%. Note for LMR13-27-096 the original validators qualified the compounds R on the report forms; however, the qualifiers were not applied in the EDD file. The UJ qualifier was added by the QATS validator.
17028 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-26-012 LMR13-27-012 LMR13-72-012	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17028 PAH	Bis(2-ethylhexyl)phthalate	J	U	LMR13-41-012 LMR13-26-012FD LMR13-57-048 LMR13-27-048 LMR13-27-072	Bis(2-ethylhexyl) phthalate was detected in all three method blanks; however, five samples were not qualified U. For these samples the value was changed to the CRQL and qualified U. Note the laboratory did not apply the B to the Lab qualifiers.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17028 PAH	Di-n-butylphthalate Butylbenzylphthalate	J	U	LMR13-26-012FD LMR13-57-048 LMR13-27-012 LMR13-27-048 LMR13-27-072	Di-n-butylphthalate and butylbenzylphthalate were detected in the associated blank; however, five samples were not qualified U. For these samples the value was changed to the CRQL and qualified U. Note the laboratory did not apply the B to in the lab qualifier column for these samples.
17052 METALS	Cadmium	J	U	LMR13-29-096	Trace levels of cadmium between the MDL and CRQL were detected in the CCBs. The original validation did not report or qualify for this calibration blank contamination. The result for one sample was adjusted to the CRQL and qualified U.
17052 MERCURY	Mercury	J	U	LMR13-28-048	Trace level of mercury between the MDL and CRQL was detected in the CCB. The original validation did not report or qualify for this calibration blank contamination. The result for one sample was changed to the CRQL and qualified U.
17052 AROCLOR	Aroclor-1242	None	J	LMR13-29-048	The original validator did not qualify for a CCV %D failure. One result was already qualified J for another reason. The QATS validator added a J qualifier to one other sample.
17052 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-28-012 LMR13-28-024 LMR13-28-048 LMR13-28-120 LMR13-29-012 LMR13-29-024 LMR13-34-012 LMR13-34-024 LMR13-34-048 LMR13-34-072 LMR13-34-096 LMR13-28-024FD LMR13-34-024FD	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17052 PAH	Pentachlorophenol	UJ	U	LMR13-28-012 LMR13-28-048 LMR13-28-024 LMR13-28-072 LMR13-28-096 LMR13-28-120 LMR13-29-012 LMR13-29-024 LMR13-29-048 LMR13-29-072 LMR13-29-096 LMR13-34-012	The original validators qualified pentachlorophenol UJ due to a closing CCV %D failure. The laboratory analyzed two closing CCVs. Pentachlorophenol was within criteria in the first CCV and out in the second CCV (50.2 %D). The J was removed from the UJ qualifier by the QATS validators due to the passing %D in the first CCV.
17054 AROCLOR	Aroclor-1016 Aroclor-1260	U	UJ	LMR13-32-012 LMR13-32-024 LMR13-32-048	The original validator did not report or qualify for CCV %D failures. The QATS validator added a J qualifier to the existing U for two compounds in five associated samples.

DATA QUALIFICATION CHANGES SUMMARY TABLE

				LMR13-40-096 LMR13-79-012 LMR13-79-024 LMR13-01-072 LMR13-38-048 LMR13-38-096 LMR13-40-048	
17061 PAH SIM	Naphthalene 2-Methylnaphthalene Acenaphthylene Benzo(e)pyrene Perylene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(g,h,i)perylene	None	J	LMR13-01-012	The sample was analyzed 42 days after extraction, which exceeds the 40-day analytical holding time. The original validators did not qualify for the holding time exceedance. Compounds not already qualified J were qualified J.
17061 PAH	Benzo(b)fluoranthene Dibenzo(a,h)anthracene	U	UJ	LMR13-79-072 LMR13-79-096 LMR13-79-024 LMR13-38-096 LMR13-01-120	The original validators did not qualify the associated samples for the initial calibration %RSD failure.
17061 PAH	Dibenzo(a,h)anthracene	U	UJ	LMR13-01-096	The original validators did not qualify the associated samples for the initial calibration %RSD failure.
17061 PAH	Benzo(b)fluoranthene	None	J	LMR13-38-012 LMR13-40-072 LMR13-40-096 LMR13-79-012 LMR13-38-048 LMR13-01-012 LMR13-01-024 LMR13-01-048 LMR13-48-024 LMR13-48-012 LMR13-48-048 LMR13-48-024FD	The original validators did not qualify the associated samples for the initial calibration %RSD failure.
17061 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-38-012 LMR13-01-072 LMR13-40-048	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC. (Unless the compound was a detected result qualified J).
17061 PAH	Di-n-octylphthalate	UJ	U	LMR13-38-048 LMR13-38-096 LMR13-40-048 LMR13-01-096 LMR13-01-120	The original validators qualified di-n-octylphthalate UJ due to a closing CCV %D failure. The laboratory analyzed two closing CCVs. Di-n-octylphthalate was within criteria in the second CCV and out in the first CCV (50.2 %D). The J was removed from the UJ qualifier by the QATS validators due to the passing %D in the second CCV.
17061 OIL AND	HEM	None	J	LMR13-79-072	These samples were extracted outside of the QAPP-required 14-day

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
GREASE		or U	or UJ	LMR13-79-096 LMR13-38-012 LMR13-40-072 LMR13-40-096 LMR13-79-012 LMR13-79-024 LMR13-38-048 LMR13-38-096 LMR13-40-048	holding time for oil and grease. The samples were qualified J or UJ. Note that some of these samples were incorrectly qualified for MS/MSD recoveries in the EDD file. The qualifiers were highlighted blue to indicate the different reason for the qualification.
17061 OIL AND GREASE	HEM	J or UJ	None or U	LMR13-01-012 LMR13-01-024 LMR13-01-048 LMR13-01-096 LMR13-01-120 LMR13-48-012 LMR13-48-024 LMR13-48-048 LMR13-48-024FD LMR13-79-024FD	The samples were incorrectly qualified for MS/MSD recoveries. The MS/MSD recoveries were within criteria for the QC sample associated with these samples.
17071 PAH	All Compounds	U, J, or None	ZZZ	LMR13-13-024	The sample was reanalyzed due to low internal standard recoveries. The re-analysis produced better results; however, the reanalysis was not included in the EDD file. Upon request, the reanalysis EDD was sent to the QATS validators and incorporated into the Region 5 EDD. The original analysis was set to NO in the reportable result column and ZZZ were entered into the validator qualifier column. The reanalysis was set to YES in the reportable result column and validation qualifiers were added as needed.
17071 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-08-048 LMR13-13-012 LMR13-13-024RE LMR13-14-120 LMR13-13-120 LMR13-14-096 LMR13-08-024 LMR13-25-072 LMR13-08-024FD LMR13-08-012 LMR13-14-012	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17071 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-13-012 LMR13-08-024	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17071 SEM MERCURY	SEM Mercury	J	U	LMR13-25-012FD	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17071 OIL AND GREASE	HEM	None or U	J or UJ	LMR13-08-012 LMR13-14-012 LMR13-14-048 LMR13-14-072 LMR13-08-048 LMR13-08-072 LMR13-13-012 LMR13-13-024 LMR13-14-120 LMR13-13-072 LMR13-13-120 LMR13-14-096 LMR13-08-024 LMR13-03-024FD	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were qualified J or UJ.
17078 METALS	Chromium Copper Zinc	J	None	LMR13-25-096 LMR13-13-048 LMR13-14-024 LMR13-71-012 LMR13-71-024 LMR13-71-048 LMR13-71-072 LMR13-07-024FD LMR13-71-024FD LMR13-07-012 LMR13-07-024 LMR13-07-048 LMR13-07-072 LMR13-21-048 LMR13-15-024FD LMR13-15-024 LMR13-21-012 LMR13-21-024 LMR13-21-072 LMR13-15-012	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
17078 AROCLOR	Aroclor-1016 Aroclor-1221 Aroclor-1232 Aroclor-1242 Aroclor-1262 Aroclor-1268	UJ	U	LMR13-13-048	Sample LMR13-13-048 was qualified UJ and J in the EDD file. The original validated Form I did not reflect qualifiers other than the U and J for the concentration qualifiers. The data validation report did not explain why qualifiers were entered for this sample. The QATS validators removed the J and left the original U.
17078 AROCLOR	Aroclor-1248 Aroclor-1254	J	None	LMR13-13-048	Sample LMR13-13-048 was qualified UJ and J in the EDD file. The original validated Form I did not reflect qualifiers other than the U and J for the concentration qualifiers. The data validation report did not explain why qualifiers were entered for this sample. The QATS validators removed the J qualifier.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17078 PAH SIM	Benzo(e)pyrene Pyrene	None	J	LMR13-21-012 LMR13-15-012 LMR13-21-012FD	The original validator did not qualify benzo(e)pyrene or pyrene for opening CCV %D failure. J qualifiers were added to the associated samples.
17078 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-71-024 LMR13-71-024FD LMR13-15-012	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC. (Unless the compound was a detected result qualified J).
17078 SEM MERCURY	SEM Mercury	J	U	LMR13-15-012	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.
17083 METALS	Copper	J	None	LMR13-87-012 LMR13-87-024 LMR13-87-072 LMR13-87-096 LMR13-86-024FD LMR13-86-012 LMR13-86-024 LMR13-87-048 LMR13-87-120 LMR13-84-024FD LMR13-84-012 LMR13-84-024 LMR13-84-048 LMR13-84-072 LMR13-86-048 LMR13-86-096 LMR13-30-012 LMR13-30-024 LMR13-30-048	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
17083 PAH	4-Chloroaniline 3,3'-Dichlorobenzidine	R	U	LMR13-87-012 LMR13-87-048	The R qualifier that was applied for the DMC recovery of 0% for 4-Chloroaniline-d_4 was removed because the sample was run at a dilution and the DMC was diluted out. The QATS validator removed the R qualifier and changed it back to the original U.
17083 PAH	Hexachlorocyclopentadiene	R	UJ	LMR13-87-012 LMR13-87-048	The R qualifier that was applied for the DMC recovery of 0% for 4-Chloroaniline-d_4 was removed because the sample was run at a dilution and the DMC was diluted out. The R qualifier was removed and replaced with a UJ because the %D for hexachlorocyclopentadiene failed criteria in the closing CCVs.
17083 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	U	LMR13-87-072	The R qualifier that was applied for the DMC recovery of 0% for 4-Chloroaniline-d_4 was removed because the sample was run at a dilution and the DMC was diluted out. The QATS validator removed the R qualifier and changed it back to the original U.
17083 PAH	4-Chloroaniline	R	UJ	LMR13-84-012	The R qualifiers originally assigned to the listed compounds in

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
	Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine			LMR13-84-024 LMR13-84-048 LMR13-84-072	samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17083 PAH	Phenanthrene Anthracene	J	None	LMR13-87-048	The J qualifier that was applied for the DMC recovery for anthracene-d_{10} was removed because the sample was run at a dilution.
17083 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-87-012 LMR13-86-012	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17083 PAH	4-Nitroaniline	UJ	U	LMR13-84-012 LMR13-84-024 LMR13-84-048 LMR13-84-072 LMR13-86-048 LMR13-86-096 LMR13-30-024 LMR13-30-048 LMR13-30-024FD	The original validators qualified 4-Nitroaniline UJ due to a closing CCV %D failure. The laboratory analyzed two closing CCVs. 4-nitroaniline was within criteria in the first CCV and out in the second CCV (53.2 %D). The J was removed from the UJ qualifier due to the passing %D in the first CCV.
17083 PAH	Indeno(1,2,3-cd)pyrene Benzo(g,h,i)perylene	J	None	LMR13-86-048 LMR13-86-096 LMR13-30-024 LMR13-30-048 LMR13-30-024FD	The original validators qualified these compounds J based on a calibration that was not analyzed within the 12-hour window. The alternate continuing calibration standard was analyzed within the 12-hour window and was within criteria for these compounds. The QATS validators removed the J qualifiers.
17083 PAH	2,4-Dinitrophenol	UJ	U	LMR13-87-024 LMR13-87-096 LMR13-87-120	The original validators qualified 2,4-Dinitrophenol UJ due to a closing CCV %D failure. The laboratory analyzed two closing CCVs. 2,4-dinitrophenol was within criteria in the first CCV and out in the second CCV (50.5 %D). The J was removed from the UJ qualifier due to the passing %D in the first CCV.
17083 PAH	Fluoranthene Benzo(a)anthracene Chrysene	J	None	LMR13-86-096	The J qualifier that was applied for the DMC recovery for pyrene-d_{10} was removed because the sample was run at a dilution. Note that the pyrene result is qualified J due to an ICAL %RSD failure.
17083 SEM MERCURY	SEM Mercury	J	U	LMR13-86-012	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.
17083 OIL AND GREASE	HEM	None or U	J or UJ	LMR13-87-012 LMR13-87-024 LMR13-87-072 LMR13-87-096 LMR13-86-012 LMR13-86-024 LMR13-87-048 LMR13-87-120 LMR13-87-024FD LMR13-84-012	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were qualified J or UJ.

(Unless the compound was a detected result qualified J).
17096 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-85-024 LMR13-85-048 LMR13-85-024FD	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17096 PAH SIM	Benzo(e)pyrene	None	J	LMR13-88-012	The original validator did not report or qualify Benzo(e)pyrene for opening CCV %D failure. A J qualifier was assigned to the associated sample.
17096 SEM MERCURY	SEM Mercury	J	U	LMR13-39-012	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.
17096 OIL AND GREASE	HEM	None or U	J or UJ	LMR13-55-048 LMR13-55-072 LMR13-89-012 LMR13-89-024 LMR13-39-048 LMR13-88-012 LMR13-88-024 LMR13-88-048 LMR13-39-012 LMR13-39-024 LMR13-39-072 LMR13-85-024 LMR13-85-048 LMR13-67-012 LMR13-67-024 LMR13-67-048 LMR13-85-012 LMR13-89-024FD LMR13-85-024FD	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were qualified J or UJ.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17099 METALS	Chromium	J	None	LMR13-86-072 LMR13-33-072 LMR13-33-096 LMR13-54-012 LMR13-54-024 LMR13-54-048 LMR13-33-024FD LMR13-33-024 LMR13-33-048 LMR13-54-072 LMR13-54-096 LMR13-54-120 LMR13-30-096 LMR13-30-120 LMR13-33-012 LMR13-55-012 LMR13-54-048FD LMR13-55-024FD LMR13-55-024 LMR13-30-072	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
17099 PAH	Phenanthrene Anthracene	J	None	LMR13-33-096	Phenanthrene and Anthracene were incorrectly qualified J by the original validators. These compounds are not associated with internal standards or DMC %R that failed criteria. There is no explanation for the qualifiers in the DVR, therefore the QATS validator removed the J qualifiers.
17099 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-86-072	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17099 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-54-120	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC. (Unless the compound was a detected result qualified J).
17099 PAH SIM	Naphthalene 1-Methlynaphthalene 2-Methylnaphthalene Acenaphthene Fluorene Anthracene Benzo(e)pyrene Perylene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(g,h,i)perylene	None	J	LMR13-54-012 LMR13-33-012 LMR13-55-012	These samples were analyzed 47 or 48 days after extraction, which exceeds the analysis holding time by 7 or 8 days. Detected compounds (not already qualified J) reported from these samples were qualified J.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17099 SEM MERCURY	SEM Mercury	J	U	LMR13-55-012	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.
17099 OIL AND GREASE	HEM	J	J	LMR13-86-072 LMR13-33-072 LMR13-33-096 LMR13-54-012 LMR13-54-024 LMR13-54-048 LMR13-33-024FD LMR13-33-024 LMR13-33-048 LMR13-54-072 LMR13-54-096 LMR13-54-120 LMR13-30-096 LMR13-30-120 LMR13-33-012 LMR13-55-012 LMR13-33-048FD LMR13-54-024FD LMR13-55-024 LMR13-30-072	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were already qualified J for failed MSD % recovery and %RPD in the EDD file. The qualifiers were highlighted blue to indicate another reason for the qualification.
17122 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-64-012 LMR13-64-048 LMR13-64-048FD LMR13-67-072 LMR13-67-096 LMR13-64-024 LMR13-64-072 LMR13-64-096 LMR13-69-012 LMR13-69-048 LMR13-92-012 LMR13-92-024 LMR13-65-012 LMR13-65-024	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC. (Unless the compound was a detected result qualified J).
17122 PAH	Hexachlorocyclopentadiene	U	UJ	LMR13-92-024	Hexachlorocyclopendadiene was not qualified UJ by the original validators. The UJ was added due to %D failures in both closing CCVs.
17122 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-64-096 LMR13-68-012 LMR13-69-024	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
17122 PAH	Bis(2-ethylhexyl)phthalate	None	UJ	LMR13-64-048FD LMR13-67-096 LMR13-67-120 LMR13-64-120 LMR13-69-072	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank. The J qualifier was added to the U because of exceeded holding time.
17122 PAH	Di-n-octylphthalate	UJ	U	LMR13-64-024 LMR13-64-072 LMR13-64-096 LMR13-92-024 LMR13-65-024 LMR13-69-024	The original validators qualified di-n-octylphthalate UJ due to a closing CCV %D failure. The laboratory analyzed two closing CCVs. Di-n-octylphthalate was within criteria in the first CCV and out in the second CCV. The J was removed from the UJ qualifier by the QATS validators due to the passing %D in the first CCV.
17122 PAH	Caprolactam	UJ	U	LMR13-68-012	The original validators qualified caprolactam UJ due to a CCV %D failure. The %D was not out of criteria for caprolactam in the associated CCV, but was out of criteria for a different analysis date. The J was removed from the UJ qualifier due to the passing %D in the associated CCV.
17122 SEM MERCURY	SEM Mercury	J	U	LMR13-65-012	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.
17122 OIL AND GREASE	HEM	J	J	LMR13-64-024 LMR13-64-072 LMR13-64-096 LMR13-64-120 LMR13-69-012 LMR13-68-012 LMR13-69-048 LMR13-69-072 LMR13-92-012 LMR13-92-024 LMR13-65-012 LMR13-65-024 LMR13-69-024 LMR13-64-012 LMR13-64-048 LMR13-64-048FD LMR13-67-072 LMR13-67-096 LMR13-67-120	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were already qualified J for failed MS/MSD recoveries in the EDD file. The qualifiers were highlighted blue to indicate another reason for the qualification.
17125 METALS	Copper	J	None	LMR13-69-024FD LMR13-69-096 LMR13-69-120 LMR13-61-012 LMR13-61-048 LMR13-61-096	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
				LMR13-65-048 LMR13-65-072 LMR13-61-024 LMR13-61-072 LMR13-61-120 LMR13-66-012 LMR13-66-024 LMR13-60-012 LMR13-60-024 LMR13-60-048 LMR13-60-072 LMR13-60-096 LMR13-66-048 LMR13-58-024	
17125 PAH	Bis(2-ethylhexyl)phthalate	None	UJ	LMR13-69-096 LMR13-69-120 LMR13-61-048 LMR13-61-096 LMR13-65-072 LMR13-61-072 LMR13-58-024	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank. The J qualifier was added to the U because of exceeded holding time.
17125 PAH	Pyrene Bis(2-ethylhexyl)phthalate	None	J	LMR13-61-024	Internal standard area recoveries for Chrysene-d12 and Perylene-d12 were out of criteria. Associated detected results (not already qualified J) are qualified J.
17125 PAH	Butylbenzylphthalate 3,3'-Dichlobenzidine Di-n-octlyphthalate Dibenzo(a,h)anthracene	U	UJ	LMR13-61-024	Internal standard area recoveries for Chrysene-d12 and Perylene-d12 were out of criteria. Associated non-detected results are qualified UJ.
17125 PAH SIM	C1-Fluoranthenes/Pyrenes C1-Chrysenes	U	J	LMR13-66-012	The original validators incorrectly qualified the sample for blank contamination. The results were qualified JB by the laboratory, B for the blank contamination and J because modification 1734.2 requires a J qualifier be added to the PAH Alkyl Homologues since no separate calibration is required for PAH alkyl homologues. The original validators incorrectly qualified these compounds U based on the J qualifier, when the actual concentration was above 10 X the CRQL. The QATS validators removed the U and replaced the qualifier with the original J.
17125 SEM MERCURY	SEM Mercury	J	U	LMR13-66-012	Trace levels of mercury between the MDL and CRQL were detected in the ICB and CCB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.
17125 OIL AND GREASE	HEM	J or UJ	J or UJ	LMR13-69-096 LMR13-69-120 LMR13-61-012	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The samples were already qualified J for MSD recovery in the EDD file. The qualifiers were highlighted blue

The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
17127 MERCURY	Mercury	J	U	LMR13-59-024 LMR13-59-048 LMR13-58-012 LMR13-70-024	Trace level of mercury between the MDL and CRQL was detected in the ICB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied to the four affected samples.
17127 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-59-012 LMR13-58-012 LMR13-70-024	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17127 PAH	Bis(2-ethylhexyl)phthalate	None	UJ	LMR13-58-012	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank. The J qualifier was added to the U because of exceeded holding time.
17127 PAH	Phenanthrene Anthracene Fluoranthene	J	None	LMR13-94-024	These compounds were qualified J by the original validators. There is no explanation for the qualifiers in the DVR, therefore the QATS validator removed the J qualifiers.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
	Pyrene Benzo(a)anthracene Chrysene				
17127 PAH	Naphthalene 2-Methylnaphthalene Fluorene Phenanthrene Anthracene Fluoranthene Pyrene	None	J	LMR13-95-024FD	This sample was analyzed 46 days after extraction, which exceeds the analysis holding time by 6 days. Detected compounds (not already qualified J) reported from these samples were qualified J.
17127 PAH	46 Compounds	U	UJ	LMR13-95-024FD	This sample was analyzed 46 days after extraction, which exceeds the analysis holding time by 6 days. Non-detected compounds reported from these samples were qualified UJ.
17127 PAH	Bis(2-ethylhexyl)phthalate	None	U	LMR13-70-024	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank.
17127 PAH SIM	C1-Naphthalenes C2-Naphthalenes C1-Phenanthrenes/Anthracenes C2-Phenanthrenes/Anthracenes C1-Fluoranthenes/Pyrenes C1-Chrysenes	U	J	LMR13-94-012 LMR13-95-012	The original validators incorrectly qualified these samples for blank contamination. The results were qualified JB by the laboratory, B for the blank contamination and J because modification 1734.2 requires a J qualifier be added to the PAH Alkyl Homologues since no separate calibration is required for PAH alkyl homologues. The original validators qualified these compounds U based on the J qualifier, when the actual concentration was above 10 X the CRQL. The QATS validators removed the U and replaced the qualifier with the original J.
17127 PAH SIM	C2-Naphthalenes C1-Phenanthrenes/Anthracenes C2-Phenanthrenes/Anthracenes C1-Fluoranthenes/Pyrenes C1-Chrysenes	U	J	LMR13-58-012	The original validators incorrectly qualified the sample for blank contamination. The results were qualified JB by the laboratory, B for the blank contamination and J because modification 1734.2 requires a J qualifier be added to the PAH Alkyl Homologues since no separate calibration is required for PAH alkyl homologues. The original validators qualified these compounds U based on the J qualifier, when the actual concentration was above 10 X the CRQL. The concentration was incorrectly changed to the lower CRQL. The QATS validators removed the U and replaced the qualifier with the original J and re-entered the original concentration in the result column.
17127 SEM MERCURY	SEM Mercury	J	U	LMR13-95-012	Trace level of mercury between the MDL and CRQL was detected in the ICB. The original validators did not qualify results for the calibration blank contamination. The result was changed to the CRQL and a U qualifier was applied.
17127 OIL AND GREASE	HEM	J or UJ	J or UJ	LMR13-59-012 LMR13-59-024 LMR13-59-048 LMR13-94-024 LMR13-94-072 LMR13-58-012	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The sample results were qualified J or UJ.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/ Compound	Original Qualifier	Revised Qualifier	EPA Sample IDs	QATS Justification for EDD Revision
				LMR13-94-012 LMR13-94-048 LMR13-95-012 LMR13-70-024 LMR13-95-024 LMR13-95-048 LMR13-95-072 LMR13-95-096 LMR13-95-024FD	
17149 METALS	Copper	J	None	LMR13-52-012 LMR13-52-024 LMR13-52-048 LMR13-53-012 LMR13-53-024 LMR13-53-024FD LMR13-56-012 LMR13-70-012 LMR13-70-048 LMR13-80-012 LMR13-80-024 LMR13-80-024FD LMR13-80-048 LMR13-80-072 LMR13-80-096	J qualifiers that were originally applied to samples for which the serial dilution %D exceeded 10% were removed if less than the expanded NFG criterion of ±15%D. The %D for the analytes listed is <15%; therefore, the J qualifiers were removed (unless the result was between the MDL and CRQL).
17149 PAH	4-Chloroaniline Hexachlorocyclopentadiene 3,3'-Dichlorobenzidine	R	UJ	LMR13-70-012 LMR13-70-048 LMR13-80-024 LMR13-52-012 LMR13-52-024FD LMR13-80-072 LMR13-53-024 LMR13-52-048 LMR13-53-012 LMR13-80-048 LMR13-80-096	The R qualifiers originally assigned to the listed compounds in samples with a 0% R for the DMC 4-Chloroaniline-d_4 were replaced with a UJ due to the low (1%R) acceptance criteria for this DMC.
17149 PAH	Bis(2-ethylhexyl)phthalate	None	UJ	LMR13-70-012 LMR13-52-024 LMR13-53-024 LMR13-80-012	In accordance with the Organic NFG, results less than 5x the CRQL were qualified with a U when bis(2-ethylhexyl) phthalate was detected in the method blank. The J qualifier was added to the U because of exceeded holding time.
17149 OIL AND GREASE	HEM	J or UJ	J or UJ	LMR13-70-012 LMR13-70-048 LMR13-80-024 LMR13-52-012 LMR13-52-024 LMR13-52-024FD	These samples were extracted outside of the QAPP-required 14-day holding time for oil and grease. The sample results were qualified J or UJ. (Note samples LMR13-52-024 and LMR13-52-024FD were already qualified J due to field duplicate RPD > 100%)

1.0 Introduction

Sediment vibrocores were collected by Ohio EPA and U.S. EPA personnel from 147 locations in the Maumee River Area of Concern (AOC) in two phases; the Spring of 1995 (Phase 1) and the Fall of 1996 (Phase 2); to investigate the distribution and magnitude of metal and organic contamination in sediments in the Maumee River AOC. Areas sampled in this study included portions of the Maumee River, Ottawa River, Swan Creek, Otter Creek, Duck Creek, and Maumee Bay (Figures 1.1 and 1.2). The cores were divided into 338 samples and analyzed using screening analysis techniques for (a) metals and other elements by x-ray fluorescence (XRF) and (b) total polychlorinated biphenyls (PCBs) and total polycyclic aromatic hydrocarbons (PAHs) by quantitative enzyme immunoassay (EIA). These screening analyses have been recommended by the U.S. EPA (1997) for the relatively rapid and inexpensive analysis of environmental samples, and have been applied to previous Ohio EPA-funded sediment and soil quality assessment studies. This report combines the screening analysis data sets for Phases 1 and 2, and:

- Compares the contaminant concentrations to toxicity-based sediment quality guideline values (Long and Morgan, 1990);
- Describes the longitudinal distribution of contaminants in surficial samples from the cores, to identify current contaminant "hot spots";
- Describes the vertical distributions of contaminants from within the cores, to assess the potential for adverse effects should sediment be displaced by natural (e.g., floods) or anthropogenic (e.g., dredging) forces;
- Presents a rank score summarizing the overall degree of contamination for each sample.
- Describes results of comparisons between the screening analysis data and confirmatory analysis data for paired samples, to assess the utility of the screening analyses;

The objective of this document is to report the status of sediment quality in the Maumee River AOC, for use by Ohio EPA staff and other parties responsible for monitoring and management of the waters and lands in the AOC.

2.0 Summary and Conclusions

- One hundred and forty-seven sediment vibrocores were collected from the Maumee River AOC in 1995 and 1996. These cores were divided into 338 sediment samples.
- The samples were analyzed, by screening analyses, for 18 elements by x-ray fluorescence spectroscopy, and for total PCBs and total PAHs by quantitative enzyme immunoassay.
- Core stratigraphy was generally similar in most of the watershed: surficial sediments were usually silt; intermediate core layers were also usually silt or silty sand; and most cores ended in silt, clay, or sometimes peat.
- Traces of oil or other obvious signs of contamination were not often noted in the cores, except in Swan Creek.

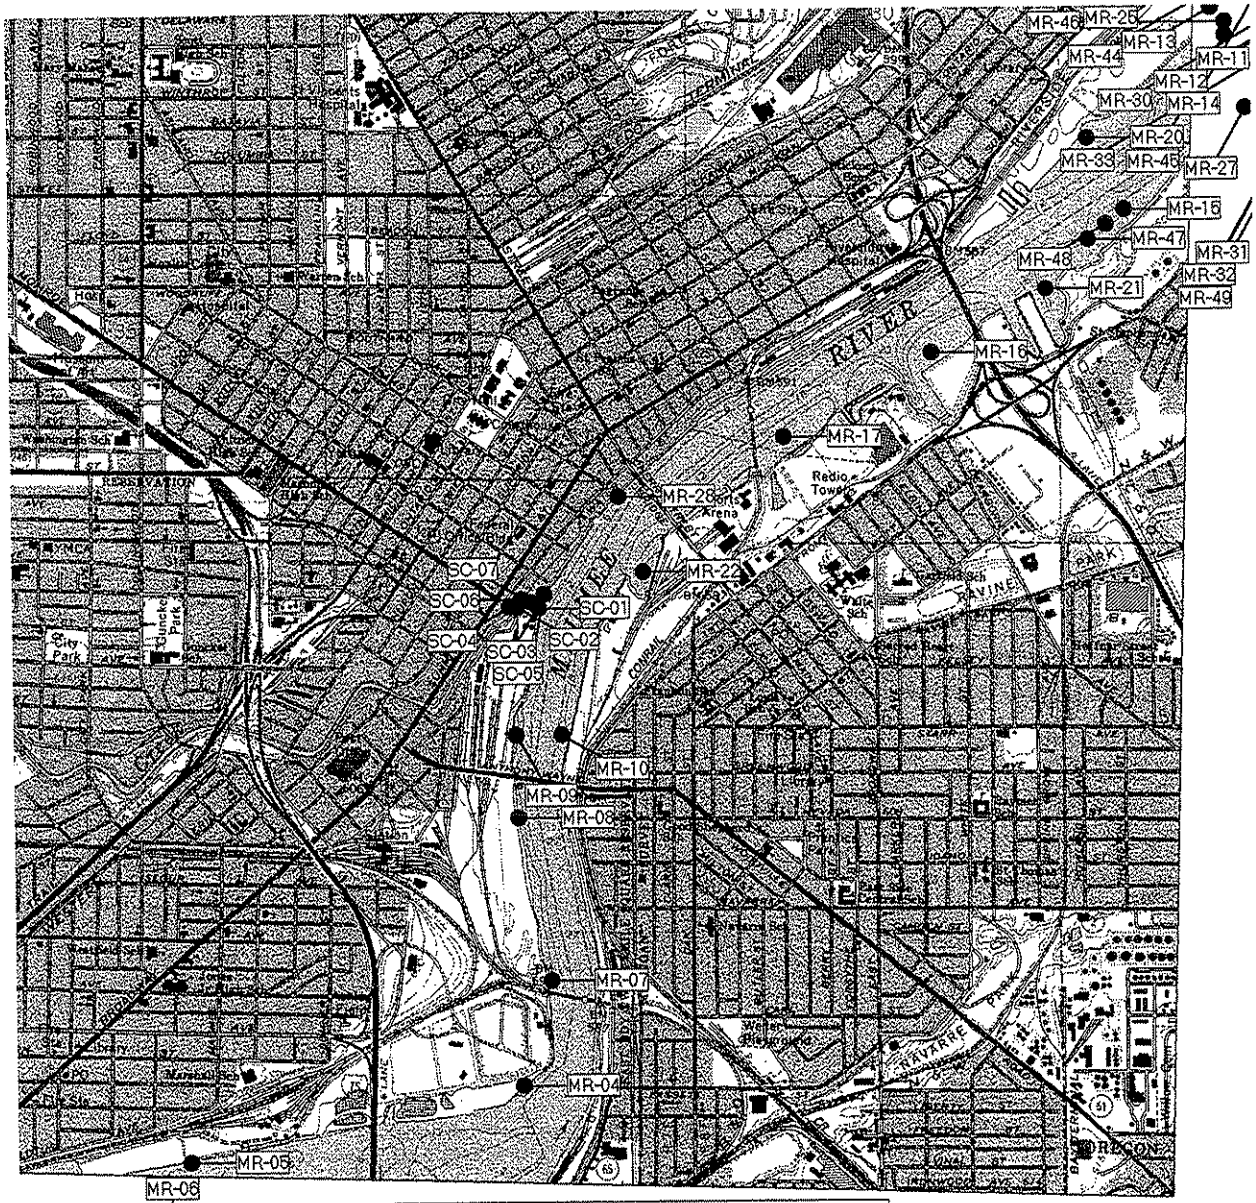

Figure 1.1. Station Locations Sampled during the Maumee River AOC Sediment Assessment Surveys - Upper Study Area

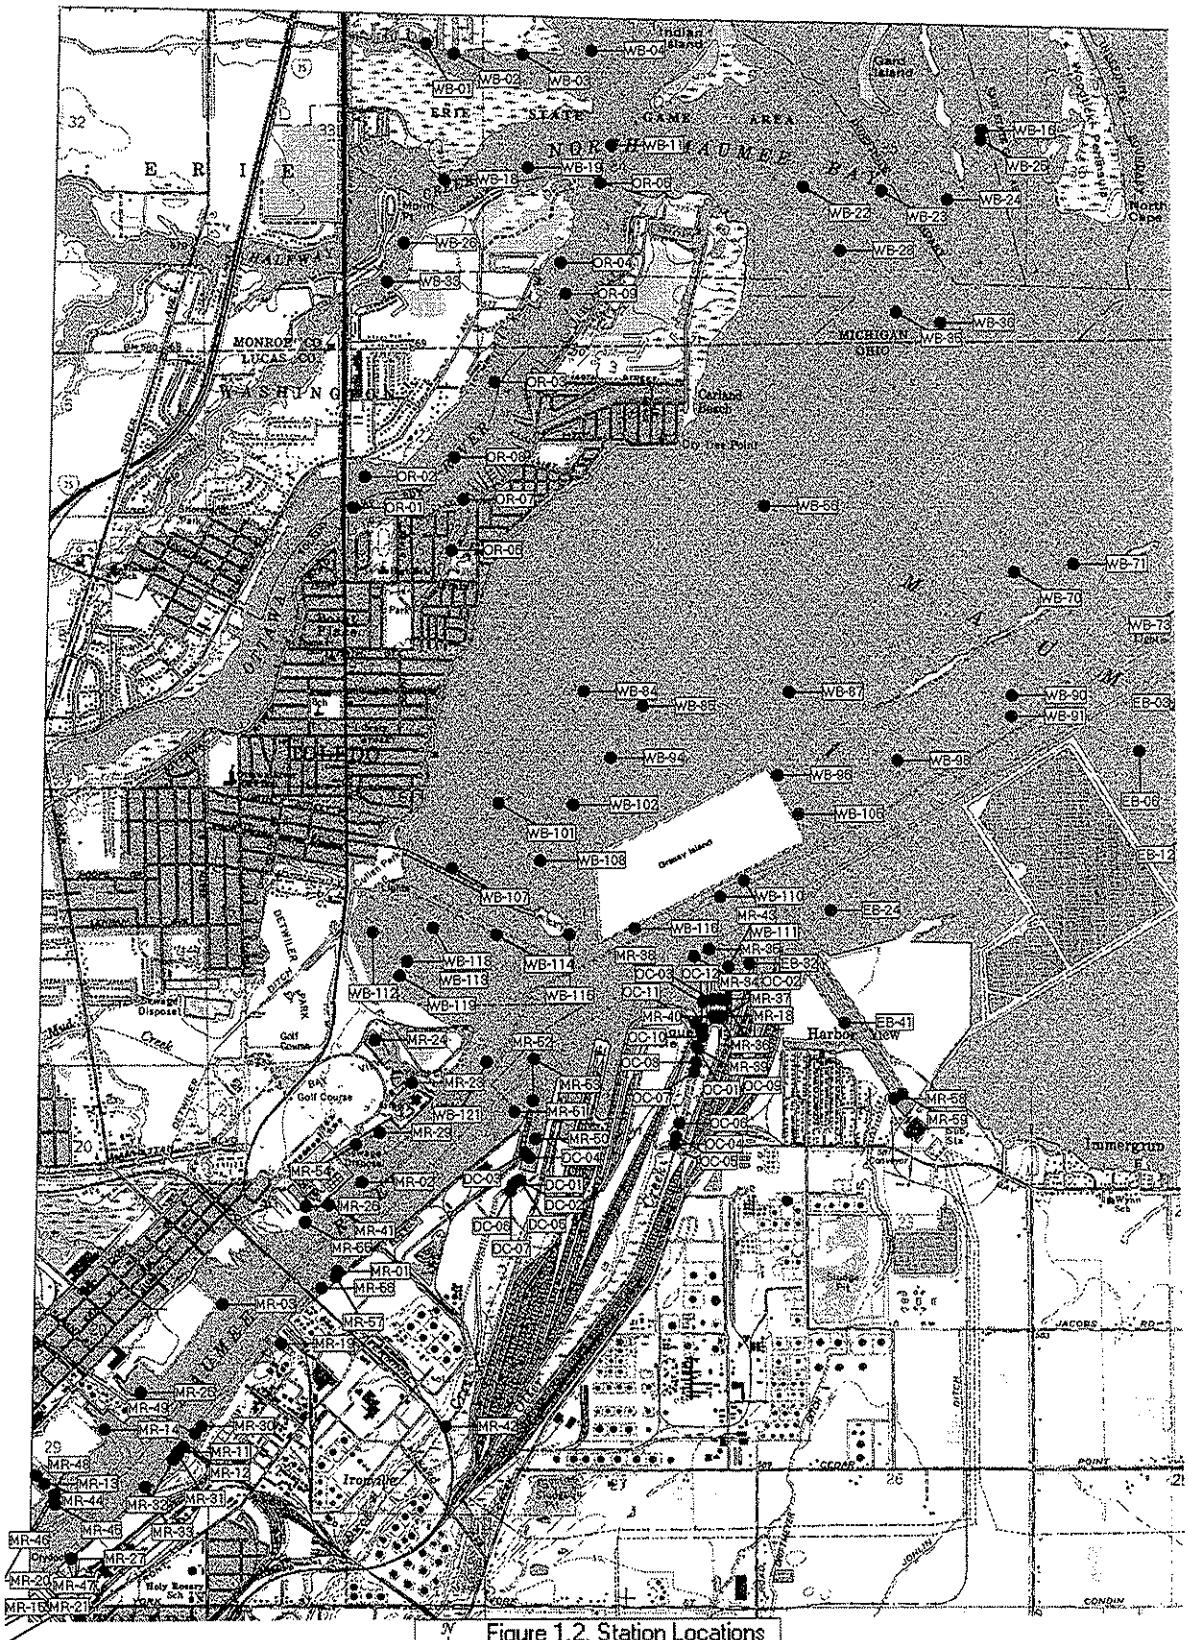

Figure 1.2. Station Locations Sampled during the Maumee River AOC Sediment Assessment Surveys - Lower Study Area
0 km
1 km
2 km
Stations

- The most highly contaminated sediments, based on individual contaminant concentrations and the results of the sample ranking calculations, were from Swan Creek.
- The least contaminated sediments, based on individual contaminant concentrations and the results of the sample ranking calculations, were from Maumee Bay.
- Prominent contaminant hot spots were located (a) near the former Toledo Coke facility; (b) near the mouth of Swan Creek; and (c) near the mouth of the Maumee River.
- Contaminant concentrations decreased or were consistent with depth in most cores.
- A fairly consistent percentage of the cores, 18% to 21%, exhibited increasing concentrations with depth for all six of the major contaminants.
- Six contaminants were present in elevated concentrations in a significant number of samples (i.e., exceeded the Long and Morgan ER-M values in 16 percent or more of the samples: chromium, lead, nickel, zinc, total PCBs, and total PAHs. These contaminants are referred to as "major" contaminants in the remainder of this report. The highest concentration observed in the study area for four of the six major contaminants occurred in the surficial layer (0"-24") of a core (Table 2.1). The other two highest concentrations occurred in subsurface layers.
- Total PCBs exceeded its ER-M value (0.40 µg/g DW) in the most samples (91%).
- Of the six major contaminants, total PAHs exceeded its ER-M value (35 µg/g DW) in the fewest samples (only 5%).
- Nickel was the metal which exceeded its ER-M value in the most samples (78%).
- According to the rank score calculations, the single most contaminated station was MR-29, on the left side of the Maumee River near the river mouth.

Table 2.1.
Highest Concentrations of the Major Contaminants Found in the Study Area

Contaminant	Station & Layer	Concentration (µg/g DW)	ER-M (µg/g DW)
Chromium	SC-04; 0"-24"	829	145
Lead	OC-10; 0"-24"	1,240	110
Nickel	MR-49; 42"-50"	292	50
Zinc	MR-12; 0"-24"	1,340	270
Total PCBs	OC-01; 28"-34"	717	0.40
Total PAHs	MR-11; 0"-24"	315	35

- Results of two of the three screening analyses, X-ray fluorescence (XRF) for metals and enzyme immunoassay (EIA) for total PCBs, moderately to strongly corresponded

with confirmatory analysis data for a subset of the samples. These screening analyses may be useful in future sediment quality assessments.

- Results of one of the screening analyses, EIA for total PAHs, did not correspond with the confirmatory data. This screening analysis should probably not be used in future sediment quality assessments.

3.0 Recommendations

- While contaminant concentrations generally decreased or were consistent with depth, concentrations increased with depth in approximately 20% of the cores. Moreover, contaminant concentrations exceeding the ER-M values often occurred in a subsurface sediment layer or in the material at the end of the cores. Consequently, future dredging or sediment remediation projects should require core sampling to evaluate contaminant distributions with depth, to ensure that newly exposed sediment layers will not contain potentially toxic contaminant concentrations.
- Two of the screening analyses used in this study; X-ray fluorescence spectroscopy for metals and enzyme immunoassay for total PCBs; seemed to produce reliable data, which could be used to identify contaminant "hot spots", and prioritize areas for remedial investigations. These assays may be useful in future sediment (or soil) contaminant screening surveys, in this AOC or elsewhere.
- One screening analysis; enzyme immunoassay for total PAHs; did not produce reliable data. This assay is apparently not useful for sediment or soil contaminant screening surveys. It would be desirable to identify another reliable screening technique for PAHs, but none are known at this time.
- Future sediment quality surveys in the Maumee River AOC may consider focusing on the six major contaminants identified in this study; chromium, lead, nickel, zinc, total PCBs, and total PAHs.
- The contaminant concentration data produced in this study, in combination with the sediment quality guideline values, are useful for assessing contaminant spatial gradients, hot spots, potential sources, and potential effects. The chemical data alone, however, do not necessarily correspond directly to predictable toxic effects. If toxicological effects from sediments are or become an issue in the Maumee River AOC, it would be desirable to perform sediment toxicity tests, to account for currently unknown factors like contaminant bioavailability.

4.0 METHODS

4.1 Sample Collection Methods

All sediment samples were collected by vibrocoring, using equipment operated from the U.S. EPA Great Lakes National Program Office's Research Vessel *Mudpuppy*. Specific details of the vibrocoring procedure are included in the project Quality Assurance Project Plan (U.S. EPA-GLNPO, 1995). In general, cores were collected in a 4"-diameter aluminum core tube equipped with a cellulose acetate butyrate plastic core liner. Cores were collected until "refusal" (i.e., the core tube encountered sediment it could not

penetrate), drained of overlying water, and transported to a shore-side facility. Here the core liners were opened, the cores were cut in half length-wise, photographed, and sediment color/texture/ odor/etc. were noted on core log forms. Cores were subsampled by a combination of predetermined intervals and core composition. For example, the 0" to 24" interval was usually collected, and then subsequent intervals were sampled based on core stratigraphy. Stainless steel implements were used for all sample processing. Sediment samples were stored on ice until transport to the laboratories.

Cores were collected from Maumee Bay, Maumee River, and four tributaries to the Maumee River (Duck Creek, Otter Creek, and Swan Creek) and Maumee Bay (Ottawa River). The upstream boundary of the Maumee River was in the vicinity of Corbutt Island. The upstream boundaries of the four tributaries were fixed bridges, beyond which the *Mudpuppy* could not pass. This was often only a short distance from the tributary mouth.

4.2 Screening Analysis Methods

Screening analysis methods were used to measure selected metals, total polychlorinated biphenyls (PCBs), and total polycyclic aromatic hydrocarbons (PAHs) in all of the sediment samples collected in this project. Total solids (sample dry weight) was also measured for all samples. In addition, PCBs and individual PAHs were measured in selected samples by conventional laboratory techniques to investigate the reliability of the screening analyses; see Section 4.3. Specific details of these analytical methods may be found in the project Quality Assurance Project Plan (U.S. EPA-GLNPO, 1995). These analyses were performed by AScI Corporation, and general descriptions of the methods are below.

Metals and selected other elements (Table 4.1) were measured in air-dried sediment using a Spectrace Model 6000 transportable x-ray fluorescence (XRF) analyzer equipped with a silicon-lithium detector and using Fundamental Parameters data analysis software. A total of 18 elements were quantified in each sample, including several required by the software for stoichiometric calculations (calcium, iron, potassium, and titanium). It should be noted that XRF quantifies the "total" metal in a sample; i.e., that metal incorporated into the mineral matrix of the sediment, as well as the metal sorbed to the sediment particles. Consequently, XRF metal concentration data are usually considered to be "conservative", and are often greater than values generated using other analytical techniques.

Table 4.1. Metals and Other Elements Measured by X-Ray Fluorescence.

Element		
Antimony	Chromium	Nickel
Arsenic	Copper	Potassium
Barium	Iron	Selenium
Bromine	Lead	Silver
Calcium	Manganese	Titanium
Cadmium	Mercury	Zinc

Total PCBs and total PAHs were measured in wet sediment using quantitative enzyme immunoassays (EIAs) manufactured by Millipore Corporation and its successor, Strategic Diagnostics Incorporated (Newark, Delaware). An aliquot of sediment was extracted with methanol using a shake extraction, and the extracts were analyzed using the quantitative technique developed by AScI. Standards of known concentrations (Aroclor 1248 for PCBs and phenanthrene for PAHs) were similarly analyzed, and used to calculate the sample concentrations using linear regression.

Total solids were measured using an Denver Instrument Company IR-100 infrared moisture analyzer, which dries samples at 105 °C to a constant weight in approximately 5 to 10 minutes. Total solids data were used to correct the PCB and PAH EIA data for sample dry weight. Dry weight correction was not necessary for the XRF analyses, since the samples were dried prior to analysis.

4.3 Confirmation Analysis Methods

A subset of 19 samples was also analyzed for metals, and 20 samples for PCBs, and PAHs by conventional laboratory methods, to investigate the accuracy of the screening analyses (XRF and EIAs). These confirmatory analyses are listed in Table 4.2. They were performed by the Ohio EPA Division of Environmental Services, and details of the results may be found in OEPA, 1995a and b.

Table 4.2. Confirmatory Analysis Procedures.

Parameter	Ohio EPA Procedures	U.S. EPA Procedures
Aluminum	400.1 / 401.1	200.2 / 200.7
Arsenic	400.1 / 407.1	200.2 / 206.2
Barium	400.1 / 401.1	200.2 / 200.7

Chromium	400.1 / 401.1	200.2 / 200.7
Copper	400.1 / 419.1	200.2 / 220.1
Iron	400.1 / 425.1	200.2 / 236.1
Lead	400.1 / 430.1	200.2 / 239.1
Mercury	400.1 / 438.2	200.2 / 245.5
Nickel	400.1 / 440.1	200.2 / 249.1
Selenium	400.1 / 450.1	200.2 / 270.2
Sodium	400.1 / 452.1	200.2 / 273.1
Strontium	400.1 / 401.1	200.2 / 200.7
Zinc	400.1 / 460.1	200.2 / 289.1
PCBs*	---	8080
PAHs**	---	8270

* Seven Aroclor mixtures quantified

** Thirteen individual PAHs quantified, along with numerous other semi-volatile compounds

Data sets for the screening and confirmatory analyses were compared by linear regression, performed in Quattro Pro. Concentrations of metals which were present below the method detection limit of either the XRF or the confirmatory metal analyses were included in the regression analysis as one-half the MDL. The same is true of the EIA data for PCBs and PAHs. The PCB and PAH confirmatory analyses quantified individual Aroclors and individual PAHs, however, and up to three Aroclor mixes (1248, 1254, and/or 1260) and up to thirteen PAHs were identified in each sample. The Aroclor values or individual PAH values were summed to produce a "total PCB" or "total PAH" concentration, for comparison to the EIA data. For "non-detect" samples in these confirmatory data sets, the detection limits for all three Aroclors or all 13 PAHs were summed and divided by 2, and this value was used in the regression analysis. Note that if, for example, only a single PAH was detected in a sample by the confirmatory analysis, it is possible that the assumed concentration in a second "non-detect" sample (one-half of the summed detection limits for all 13 PAHs) could be higher than the measured concentration in the first sample.

The strength of the confirmatory analysis:screening analysis correlation was evaluated using both the coefficient of determination (r^2) of the regression analysis and by comparing the concentration ranges of the each analysis. For example, a case where every concentration value of both the screening analysis and the confirmation analysis was less than the ER-L value would indicate a strong agreement between the two data sets, even if the r^2 value was low. In general, the statistical strength of the correlation was evaluated as per Table 4.3.

Table 4.3. Interpretation of r^2 values.

r^2 Value	Correlation Strength
$r^2 > 0.80$	"Strong"
$0.80 > r^2 > 0.60$	"Moderate"
$r^2 < 0.60$	"Poor"

4.4 Contaminant Concentration Data Interpretation Procedures. Two sets of sediment quality guideline values were used to interpret the contaminant concentration data generated in this study: the Long and Morgan guideline values established by NOAA (Long and Morgan, 1990), and a set of "background concentration" values established by the Illinois EPA (Kelly and Hite, 1984). It should be noted that criteria were not available for every contaminant detected in the course of this study, and that some of the toxicity guideline values and background concentrations are less than the detection limits of the analytical methods employed in this study.

The Long and Morgan toxicity-based sediment quality guidelines are derived from the Apparent Effects Threshold Approach, which uses quantitative relationships between individual sediment contaminants and observed biological effects to predict the sediment concentration of a contaminant above which significant biological effects may be expected

to occur. The Long and Morgan guidelines identify two sets of values for assessing sediment quality:

- Effects Range - Low (ER-L): contaminant concentrations above which adverse effects may occur in sensitive macroinvertebrate species and/or life stages (e.g., mayflies and caddisflies, or larval fish).

- Effects Range - Median (ER-M): contaminant concentrations above which effects frequently or always occurred (in the data base used to calculate the guideline values).

The Long and Morgan sediment quality guideline values cited in this study are listed in Table 4.4.

Table 4.4. Long and Morgan Sediment Quality Guideline Values.

Contaminant	ER-L (µg/g DW unless otherwise noted)	ER-M (µg/g DW unless otherwise noted)
Arsenic	33	85
Cadmium	5	9
Chromium	80	145
Copper	70	390
Lead	35	110
Mercury	0.15	1.3
Nickel	30	50
Zinc	120	270
Total PCBs	50 ng/g	400 ng/g
Total PAHs	4,000 ng/g	35,000 ng/g

It should be noted that sediment quality guideline values based on chemical concentrations in bulk sediment do not necessarily correspond directly to environmental risk, since they do not account for factors like contaminant availability. O'Conner et. al (1998) found that while guidelines based on bulk chemistry are useful for identifying samples of potential toxicological concern which may require further analysis, they should not be used alone as indicators of toxicity.

Kelly and Hite's background concentration values were derived from data for sediment samples collected by the Illinois EPA in support of water quality monitoring studies during the period 1974 to 1980. Land use information was used to identify 94 sampling sites which could be considered unimpacted by point or non-point source discharges, other than agricultural inputs. Background concentration values cited in this report are in Table 4.5.

Table 4.5. Contaminant "Background" Concentration Values For Illinois Stream Sediments.

Contaminant	Background Concentration (µg/g DW unless otherwise noted)
Arsenic	5.16
Cadmium	< 0.53
Chromium	9.78
Copper	14.9
Lead	16.7
Mercury	0.042
Zinc	50.3
Total PCBs	< 10 ng/g DW

4.5 Sample Ranking Procedures

Samples were ranked for their overall extent of contamination using the ranking procedure described by the U.S. EPA Great Lakes National Program Office (U.S. EPA, 1994). In this procedure, concentrations of each measured contaminant are scaled from 1 to 100, relative to each other; i.e., the lowest concentration for a given contaminant becomes 1, and the highest concentration becomes 100. The formula for calculating the sample-specific rank scores is:

$$\text{Rank} = 1 + [(\text{Site Value} - \text{Minimum Value})/(\text{Maximum Value} - \text{Minimum Value})] \times 99$$

Results of this ranking procedure provide a multi-contaminant summary of the degree of contamination at any one sample, in comparison to the rest of the samples in the study.

A limitation of sample ranking is that the rank scores are artifacts of the data set used to calculate them, and do not necessarily correspond to environmental risk. For example, the sample in the data set with the highest zinc concentration receives a rank of 100 for zinc, even if that concentration is so low it could not possibly cause toxic effects. Consequently, the bulk of the discussion in this report concerns comparisons between the measured contaminant concentrations and the toxicity-based sediment quality guideline values, rather than the sample ranking results.

5.0 Results and Discussion

5.1. Summary of Sediment Contamination Throughout the Study Area

The following discussions concern the screening analysis data; XRF for metals and EIA for PCBs and PAHs. All of the screening analysis data are in Appendices A (XRF), B (PCB EIA) and C (PAH EIA). See Section 5.5 for a comparison of the screening analysis data and the confirmatory data.

5.1.1. Comparisons to Illinois "Background" Criteria

The large majority of the contaminant concentrations measured in the Maumee River AOC sediments exceeded the "background" values established by Kelly and Hite (1984; Table 5.1). Essentially all of the sediment samples have been impacted by anthropogenic

Table 5.1.
Percentage of Samples below Kelly and Hite's Illinois Background Criteria

Parameter	Background Criteria (µg/g DW)	Less Than Background Criteria (%)
Chromium	9.78	1
Lead	16.7	16
Nickel	---	---
Zinc	50.3	3
Total PCBs	< 0.01	0
Total PAHs	---	---

--- Criteria not available

contamination, even those samples from the upstream boundaries of the study area.

5.1.2. Comparison to the Long and Morgan Sediment Guideline Values

The Long and Morgan toxicity-based sediment quality guideline values indicate whether a sediment sample might be expected to cause significant toxic effects in aquatic organisms in general (the ER-M value) or in sensitive aquatic species or life stages (the ER-L value). Measured concentrations of three metals of potential toxicological concern and for which sediment guideline values have been established - arsenic, cadmium, and copper - were generally low, exceeding their ER-Ms in less than 2% of the samples. Six other "major" contaminants; chromium, lead, nickel, zinc, total PCBs and total PAHs; exceeded their ER-M values in at least 5% of the samples. Distributions of these major contaminants are summarized below, and discussed in detail in Section 5.2 (surficial sediments) and Section 5.3 (sediment cores).

- The percentage of samples that exceeded the ER-M values for the six major contaminants in the Maumee River AOC (Table 5.2), indicating the possibility of significant toxicity to aquatic organisms, ranged from 5% (total PAHs) to 91% (total PCBs). The percentage of samples that were between the ER-L and ER-M in the study area, indicating the possibility of toxicity to sensitive aquatic species or life stages, ranged from 10% (total PCBs) to 82% (zinc).
- Sediments in Swan Creek were more contaminated than elsewhere in the study area, with over 50% of the samples being highly contaminated (> ER-M) for lead, nickel, zinc, and total PCBs. Swan Creek was also the most contaminated location for total PAHs (17% of the samples > ER-M).
- Maumee Bay was generally the least contaminated portion of the study area, with only a small percentage of samples exceeding the ER-M values for lead, nickel, zinc, and total PAHs.
- Nickel was the metal which most often exceeded its ER-M, in 78% of the samples overall.
- Total PAHs exceeded their ER-M in only 5% of the samples. This matches the field notes and core logs, which seldom mentioned oil sheens or odors in the samples.

It should be noted that the ER-M for total PCBs, 0.4 µg/g DW (400 µg/Kg DW), is rather low and likely to be exceeded by the majority of sediment samples from an urbanized study area like the Maumee River AOC. Long and Morgan (1990) stated that the degree of confidence in the ER-L (0.05 µg/g DW) and ER-M values should be considered as moderate; they are based on a large number of studies from across the country, including toxicity tests, benthic invertebrate community structure studies, and equilibrium partitioning modeling, but the results of these studies were sometimes quite variable. They state that the effects associated with PCBs in sediments is highly dependent on the bioavailability of the PCBs, and is not necessarily proportional to their absolute concentration. Sediment organic carbon is the major factor controlling the bioavailability of PCBs and other hydrophobic organic contaminants. TOC was not measured in this study.

5.2. Contaminant Concentrations in Surficial Sediment Samples

Contaminant concentrations in the surficial samples from each core are important toxicologically, since these are the sediments to which organisms are exposed under current conditions. Surficial samples in this study generally correspond to the top 24" of each core.

5.2.1. Duck Creek Surficial Sediments

Duck Creek is approximately 3.5 miles long, but only the lower 100 feet (0.02 miles) was sampled. Seven cores were collected. Concentrations of selected chemicals in surficial samples from the Duck Creek cores are plotted in Figures 5.1 - 5.6.

Table 5.2. Comparison of Contaminant Concentrations to Sediment Quality Guidelines

Area*	Chromium		Lead		Nickel		Zinc		Total PCBs		Total PAHs

Longitudinal Profile of Nickel

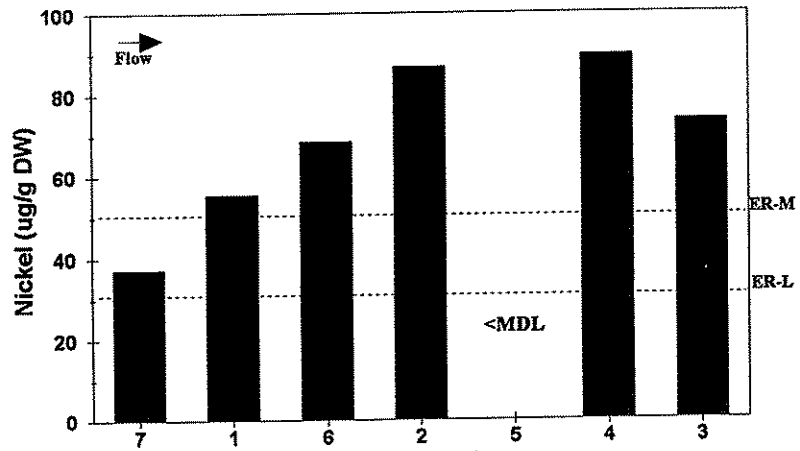

Figure 5.4. Duck Creek
Longitudinal Profile of Zinc

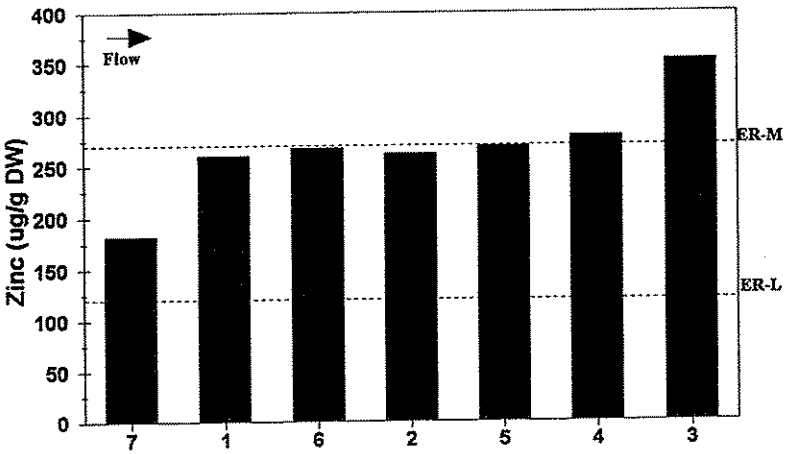

Figure 5.5. Duck Creek
Longitudinal Profile of Total PCBs

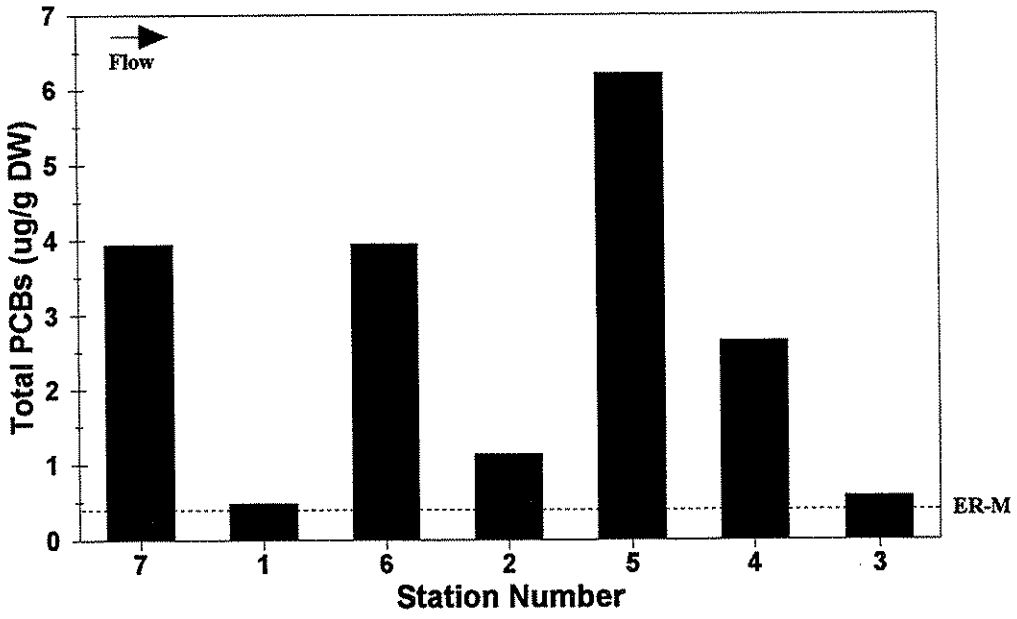

Figure 5.6. Duck Creek
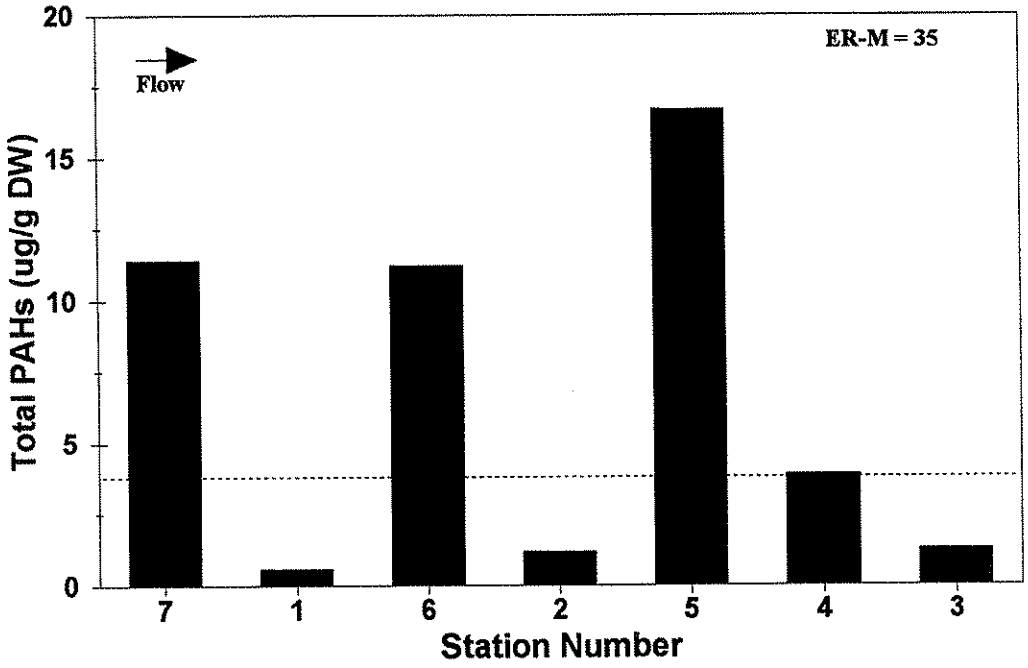
Longitudinal Profile of Total PAHs



Metals

- Most of the surficial samples were moderately contaminated with chromium and lead; concentrations were generally between the ER-L and ER-M values. The majority of samples were highly contaminated for nickel and lead; 5 of 7 samples exceeded the nickel ER-M and 6 of 7 samples exceeded the zinc ER-M.

Total PCBs and Total PAHs

- Concentrations of total PCBs and total PAHs were consistently higher in surficial sediment at stations DC-07, DC-06, DC-05, and DC-04 than at the other three stations. These four stations were all sampled in 1996, while DC-01, DC-02, and DC-03 were sampled in 1995, suggesting the possibility of a pollution episode between the sampling surveys. Surficial sediments at station DC-05 exhibited the highest concentration of both total PCBs (6.21 µg/g DW) and total PAHs (16.7 µg/g DW).

5.2.2. Maumee River Surficial Sediments

Fifty-nine cores were collected from the lower 7.5 miles of the Maumee River, usually along the margins of the river, outside of the shipping channel.

Metals

- At most of the stations sampled, chromium, lead, nickel, and zinc concentrations were generally between the ER-L and the ER-M values (Figures 5.7 - 5.10).
- Concentrations consistently exceeded the ER-M for chromium, lead, nickel, and zinc on the left side of the river from Harrison Marina downstream to the Toledo Yacht Club (stations MR-26 → MR-23). The 1991 NOAA hydrographic chart indicates that this area is a discrete shoal of deposited sediment, usually in less than 5 feet of water.
- Additional locations exhibiting elevated metal concentrations (greater than the ER-Ms) included station MR-31 (lead and zinc), MR-12 (chromium, lead, nickel, and zinc), MR-30 (lead, nickel, and zinc), and MR-56 (lead, nickel, and zinc). These locations are all on the right side of the river, from the swing bridge near the Toledo Coke Facility to just downstream of Ashland Oil.
- The highest zinc concentration found in the study area was 1,340 µg/g DW, in the 0"-24" layer of core MR-12.

Total PCBs

- Fifty-four of 59 (92%) surficial samples exceeded the ER-M for total PCBs (Figure 5.11). The highest total PCB concentrations (greater than 10 µg/g DW) tend to occur in the vicinity of the Toledo Coke Facility, between stations MR-49 and MR-12. Possible coal tar residues were noted in samples MR-30, MR-32, and MR-31. Station MR-31 contained 42.1 µg/g DW total PCBs, the highest surficial PCB concentration

Figure 5.7. Maumee River
Longitudinal Profile of Chromium

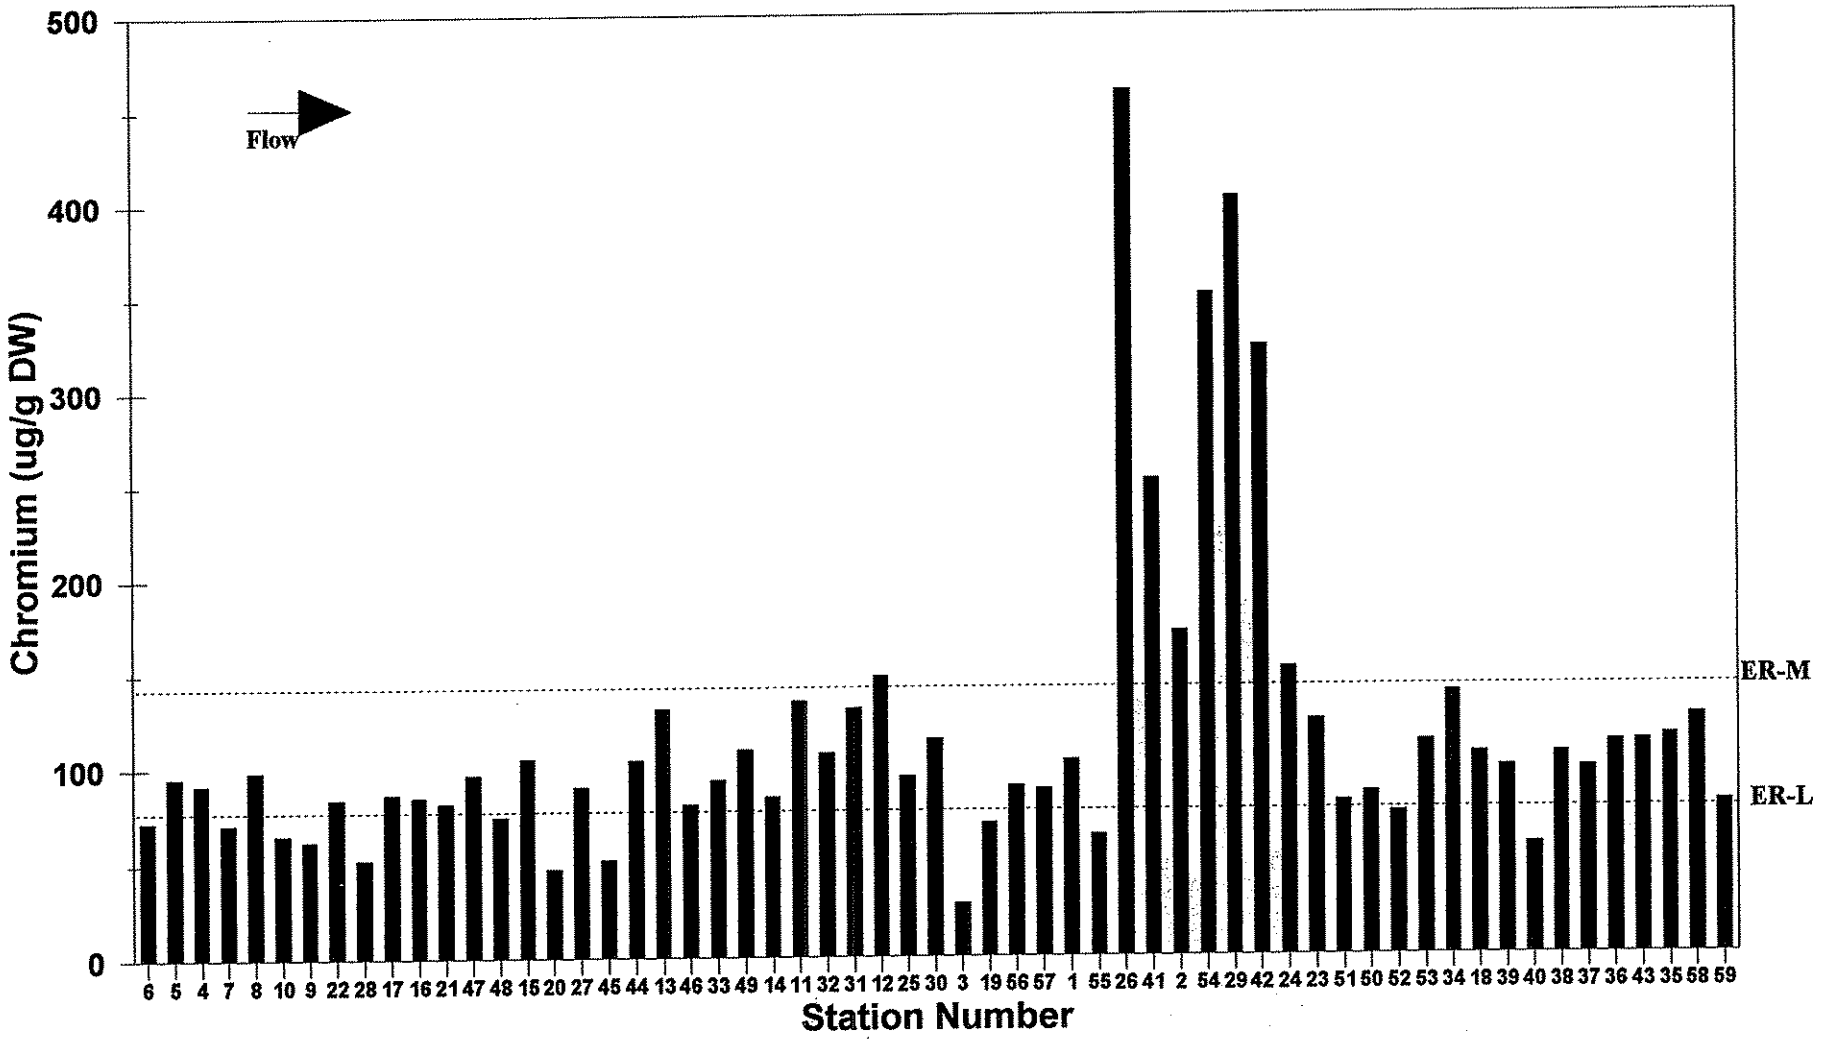


Figure 5.8. Maumee River Longitudinal Profile of Lead

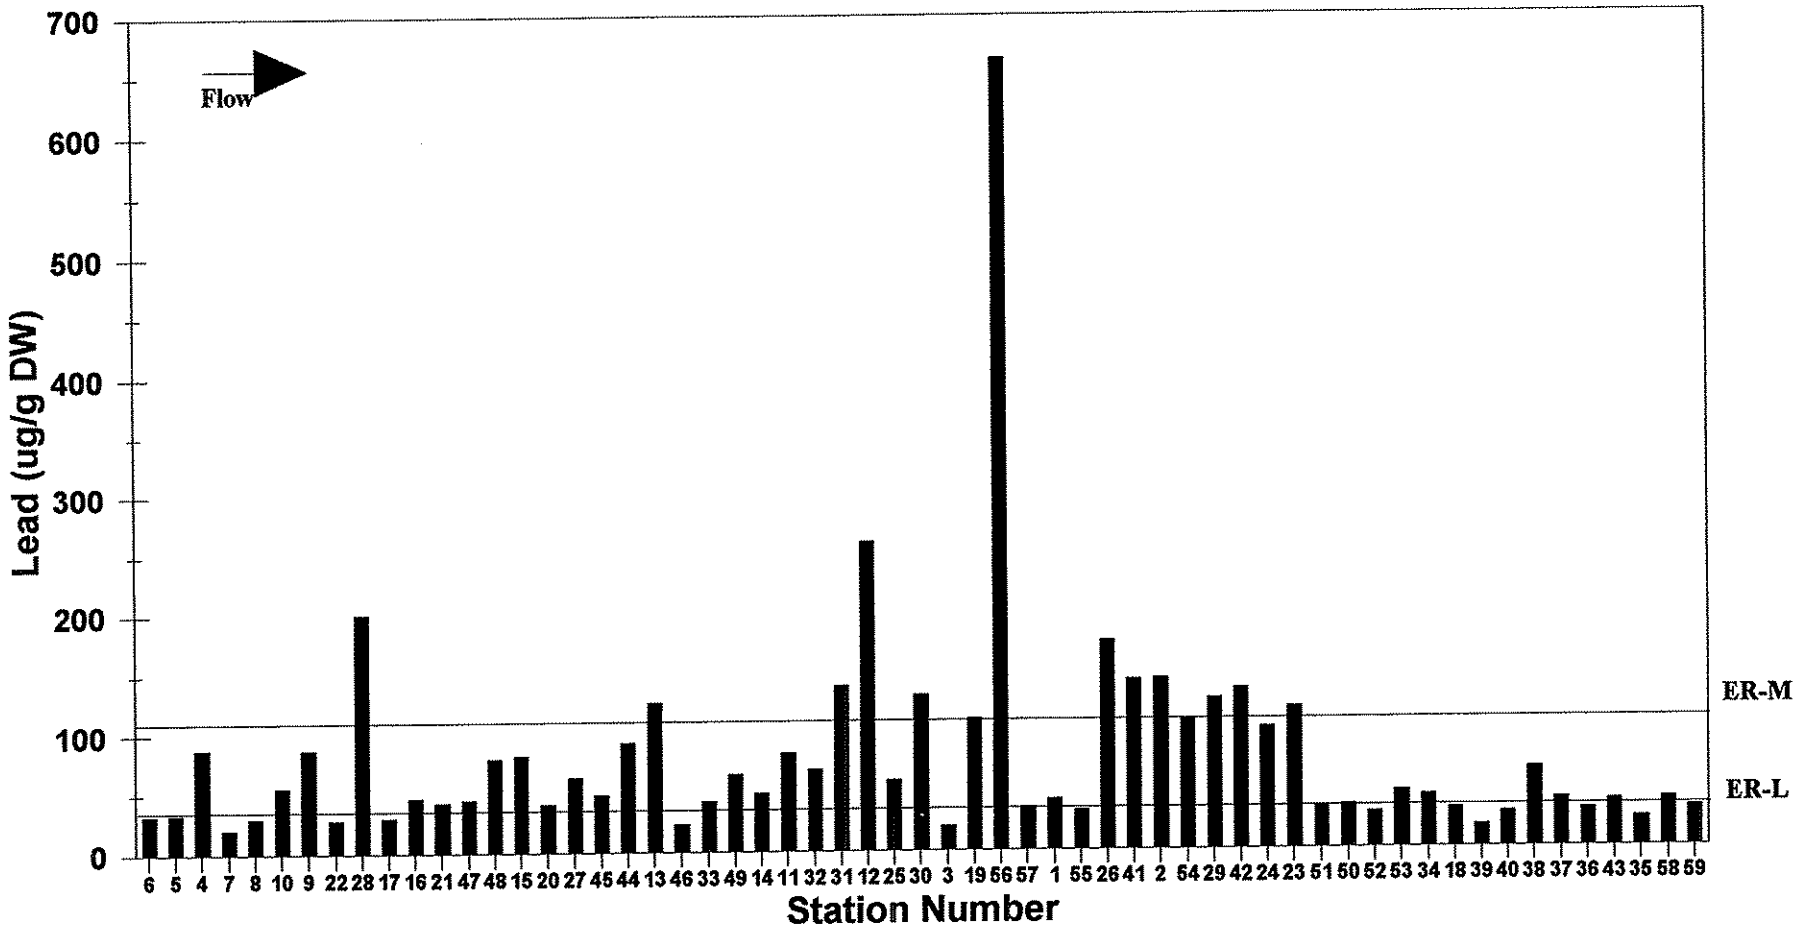

Figure 5.9. Maumee River
Longitudinal Profile of Nickel

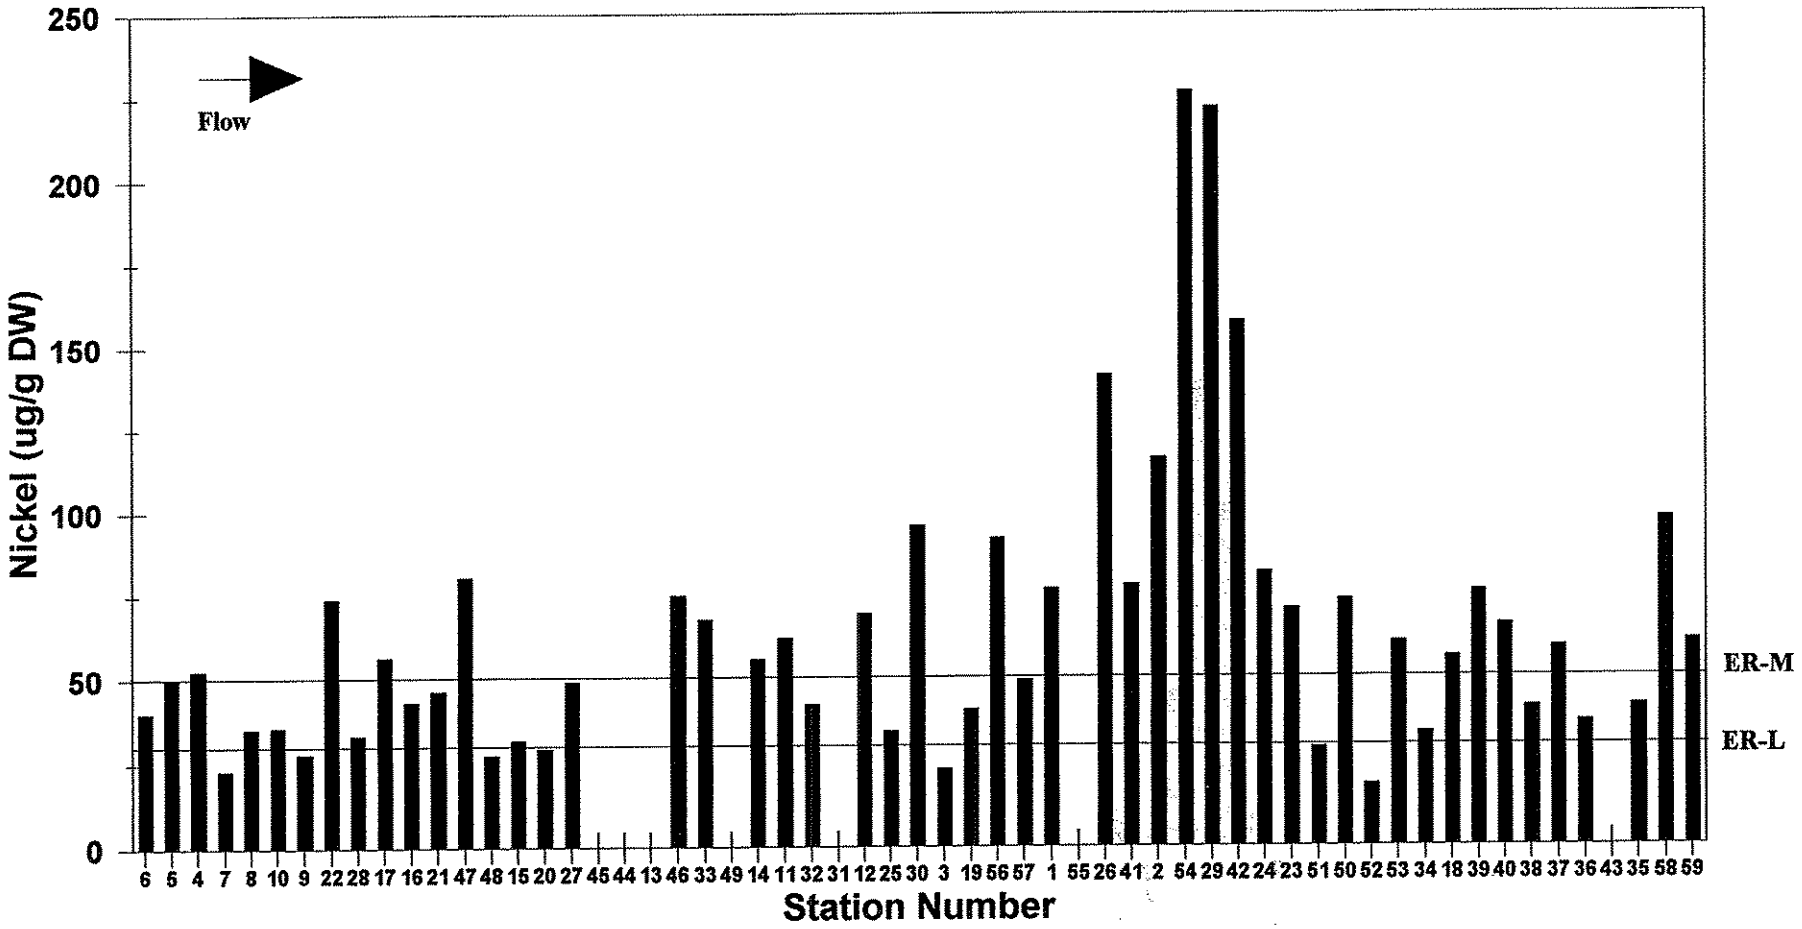

Figure 5.10. Maumee River Longitudinal Profile of Zinc

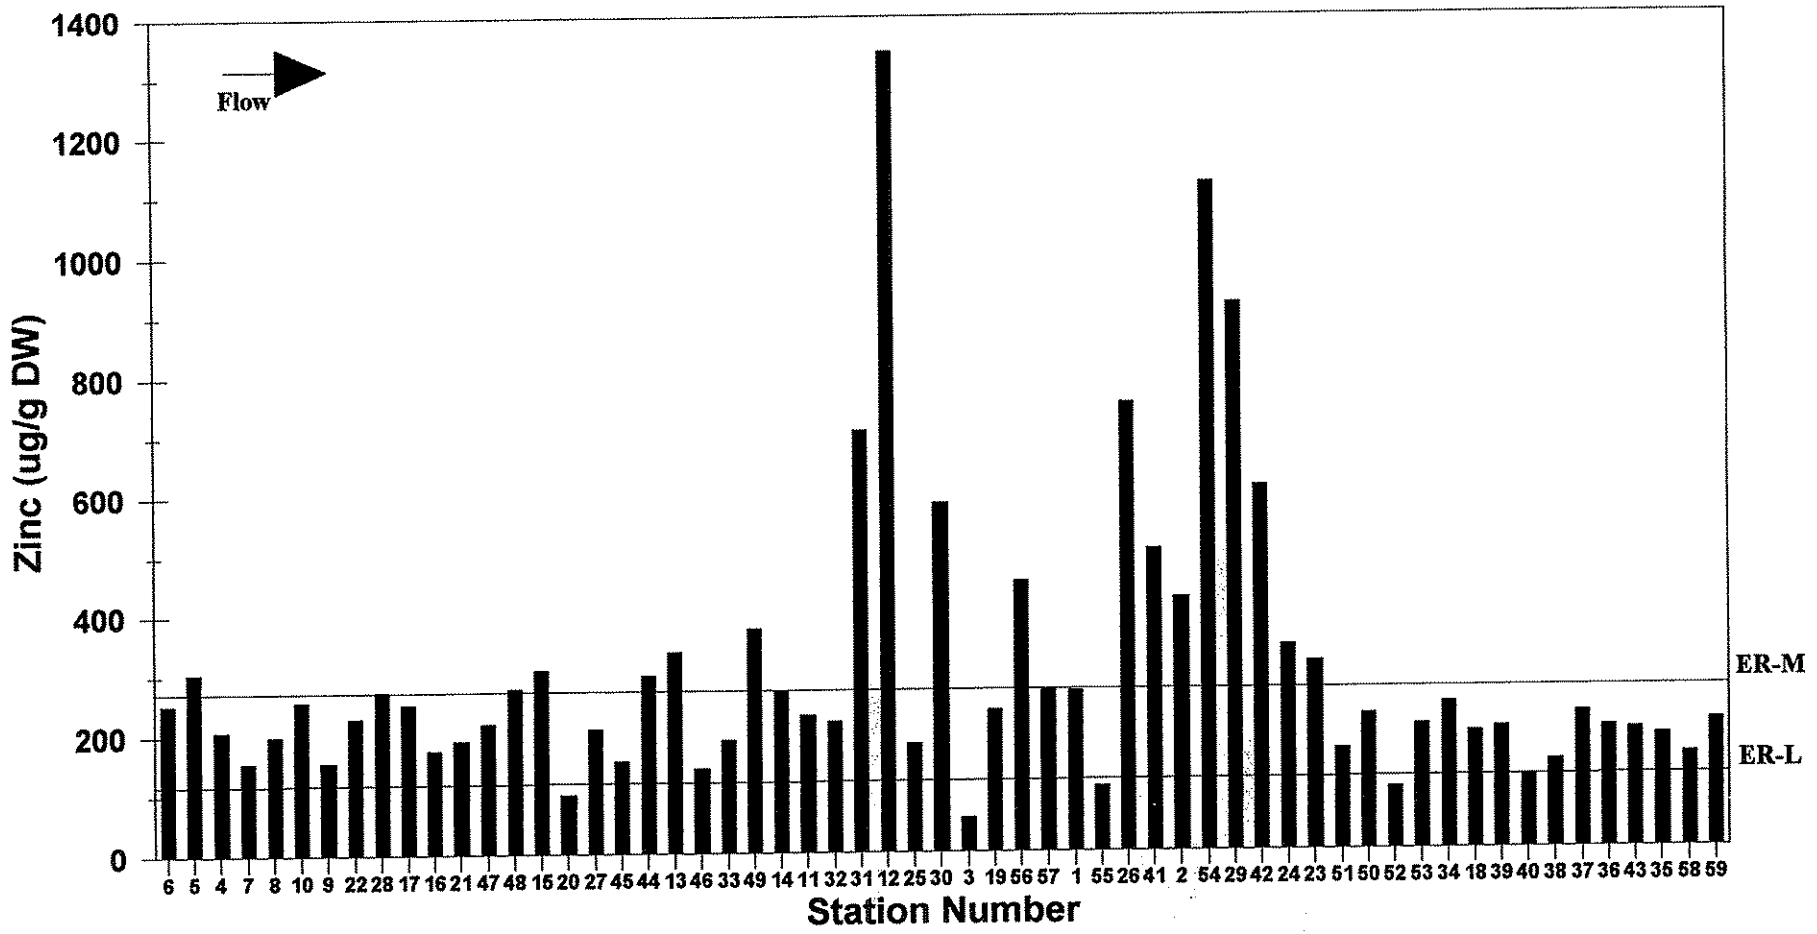

Figure 5.11. Maumee River Longitudinal Profile of Total PCBs

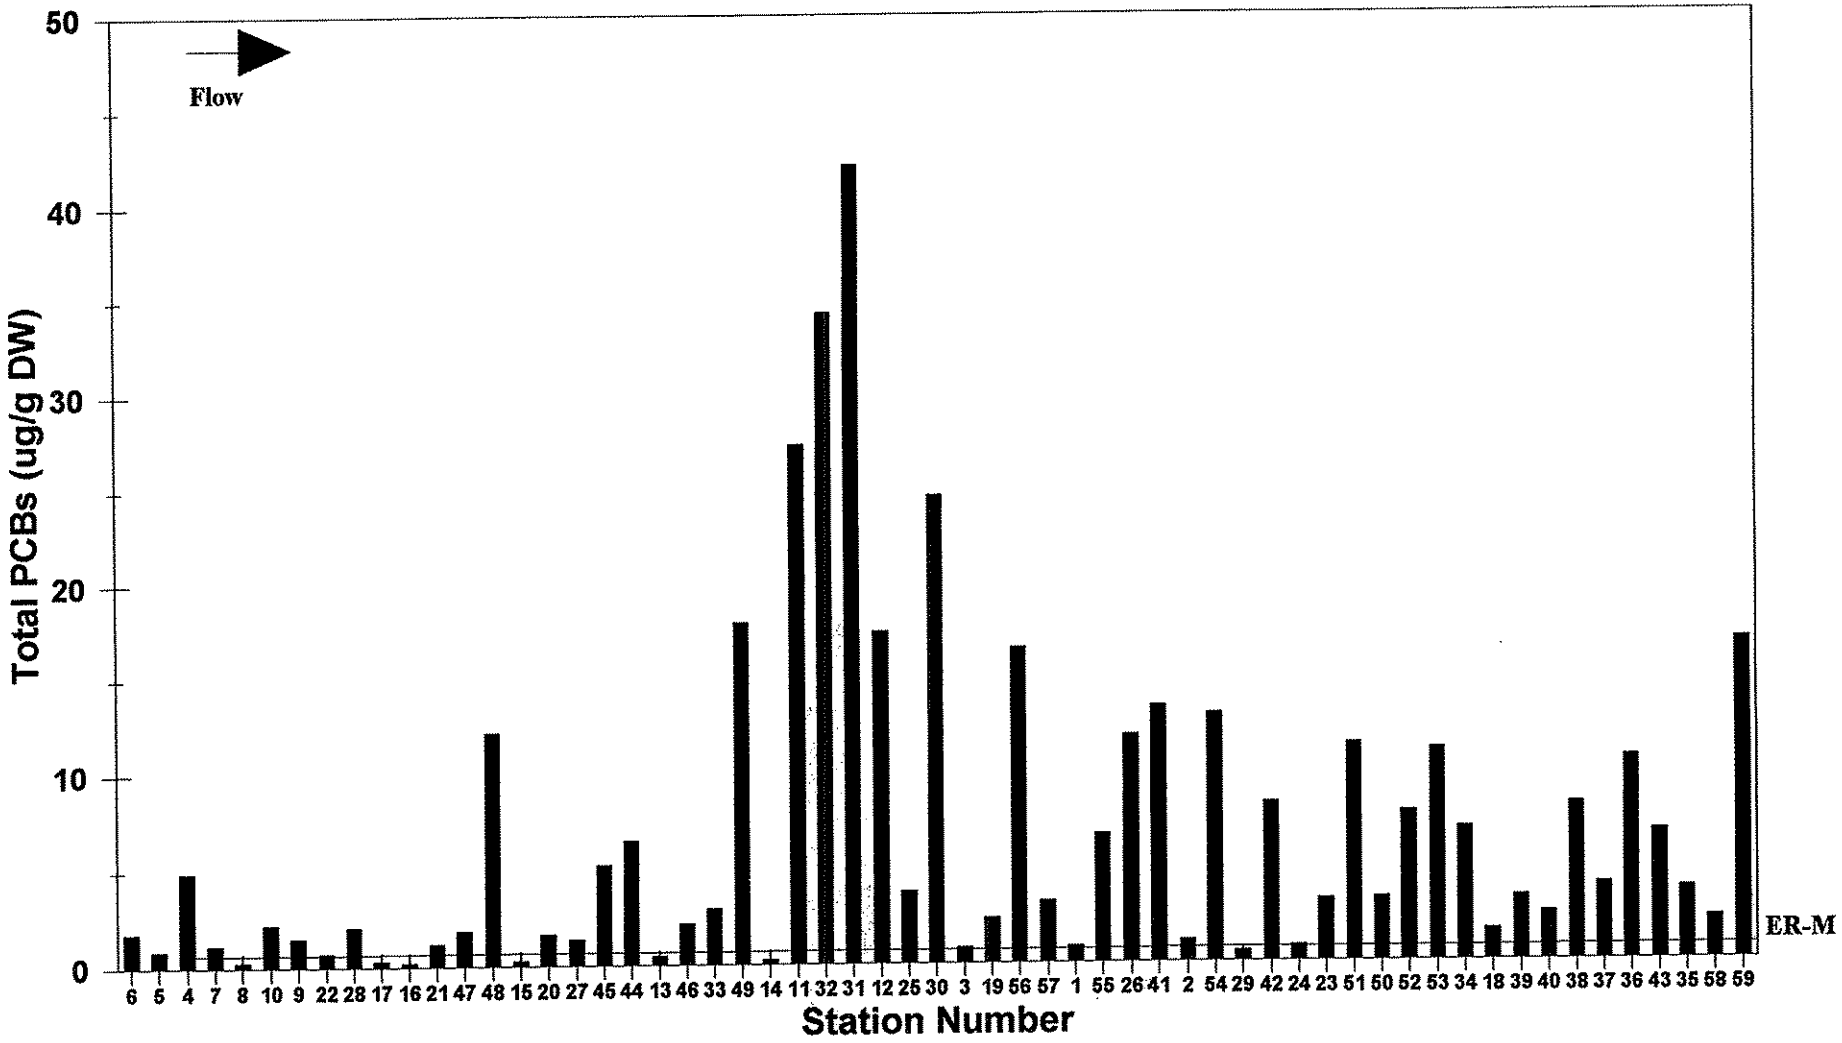

in the Maumee River. This core also contained the second the highest PCB concentration found in the study area; 348 µg/g DW, in the 46"-51" layer.

Total PAHs

- Twenty-eight of 59 Maumee River surficial sediment samples (47%) contained total PAHs that were less than the ER-L (Figure 5.12). Twenty-six (44%) of the samples were moderately contaminated with PAHs (between the ER-L and the ER-M). Only four surficial samples exceeded the ER-M: those from stations MR-49, MR-11, MR-12, and MR-59. Highest total PAHs concentrations were at MR-11 (315 µg/g DW, the highest in the study area) and MR-12 (159 µg/g DW), both adjacent to Toledo Coke.

5.2.3. Ottawa River Surficial Sediments

Nine cores were collected from the lower 1.5 miles of the Ottawa River, downstream of the Summit Road bridge. Samples were collected in 2 to 3 feet of water.

Metals

- Chromium, lead, nickel, and zinc concentrations all generally declined from upstream to downstream (Figures 5.13-5.16). Surficial sediment at the two upstream-most stations (OR-01 and OR-02) exceeded the ER-M values for all four metals, while the downstream-most station (OR-05) did not exceed the ER-L for any metal.

Total PCBs

- Stations OR-06, OR-07, and OR-08 are within a tributary along the Ottawa River and a stormwater drain feeds into this tributary. Also, a CSO and lift station are near these three stations. These stations exhibited the highest concentrations of total PCBs, ranging from 4.8 to 5.3 µg/g DW (Figure 5.17).

Total PAHs

- For total PAHs, surficial sediments at stations OR-03 and OR-04 were below the ER-L. The remaining 7 stations were moderately contaminated (between the ER-L and the ER-M) and OR-08 contained the highest total PAHs concentration (23.4 µg/g DW) observed in the Ottawa River stations (Figure 5.18).

5.2.4. Otter Creek Surficial Sediments

Otter Creek is approximately 8.2 miles long, but only the lower 2,900 feet was sampled in this study. Twelve cores were collected, approximately every 200 feet in the stream channel.

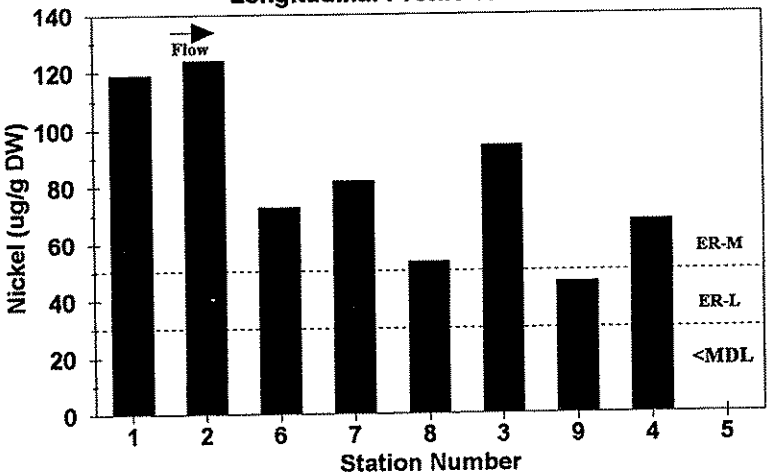

Figure 5.16. Ottawa River Longitudinal Profile of Zinc

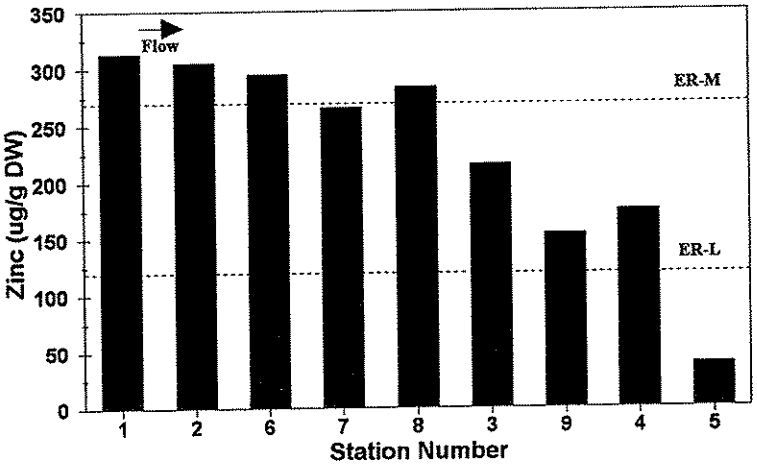

Figure 5.17. Ottawa River
Longitudinal Profile of Total PCBs

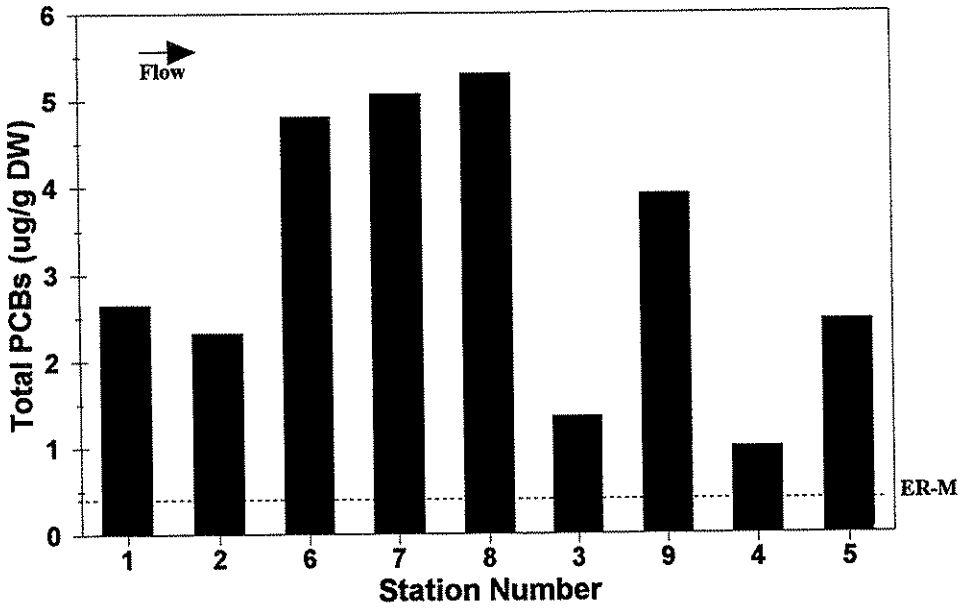

Figure 5.18. Ottawa River
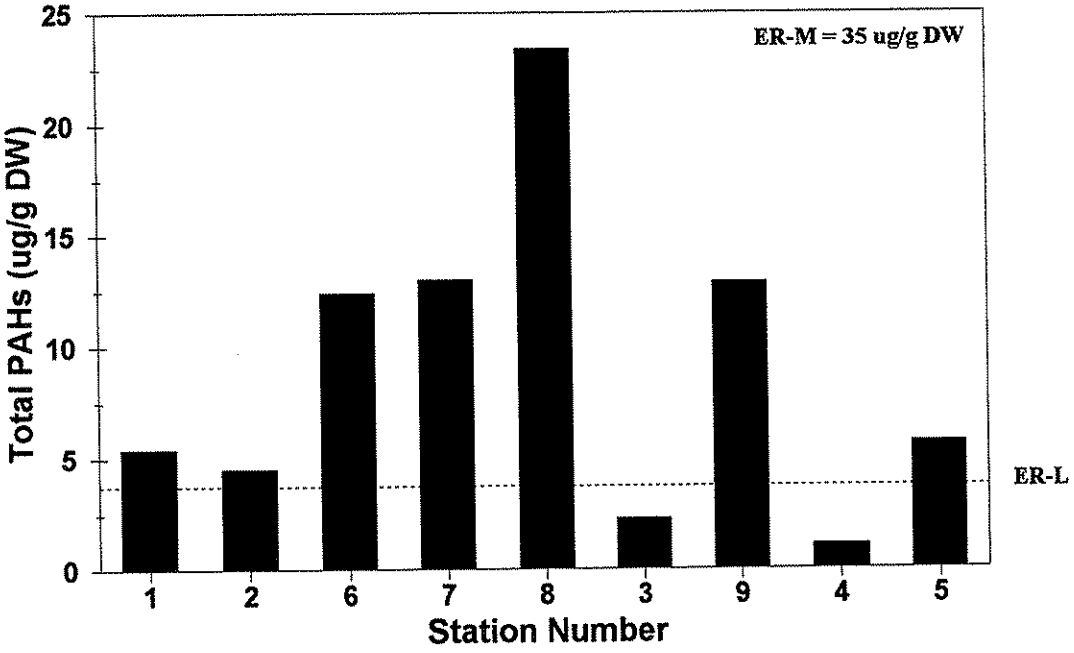
Longitudinal Profile of Total PAHs



Metals and Total PCBs

- Spatial distributions of chromium, nickel, and zinc were similar: increasing concentrations between stations OC-04 and OC-06; a substantial decline at OC-07 and OC-08; and then intermediate and variable concentrations downstream to OC-03 (Figures 5.19, 5.21, and 5.22).
- Spatial distributions of lead and total PCBs were also similar (Figures 5.20 and 5.23), with greatly elevated concentrations at OC-10 and lower concentrations elsewhere.
- The lead concentration in the surficial station at OC-10, 1,240 µg/g DW, was the highest found in the study area. This sample also contained 57.6 µg/g DW total PCBs. This station is near an outfall on the CSX Railway property, and the surficial sediments exhibited a strong petroleum odor.

Total PAHs

- The spatial distribution of total PAHs was somewhat similar to that of chromium, nickel and zinc; increasing concentrations between OC-04 and OC-06, and then intermediate and variable concentrations downstream to OC-03 (Figure 5.24).

5.2.5. Swan Creek Surficial Sediments

Only the lower 500 feet of Swan Creek, downstream of the Monroe Street bridge, was sampled. Seven cores were collected. Potential pollution sources to Swan Creek, upstream of the study area, include a number of combined sewer overflows and a former creosote facility.

Metals

- Spatial distributions of chromium, lead, nickel, and zinc in the surficial sediments were generally similar (Figures 5.25 - 5.28); concentrations at stations SC-04 through SC-02 were generally higher than at stations further downstream (although the study area is quite small), and the highest concentration of each metal was found at Station SC-04.
- The chromium concentration in the surficial layer at station SC-04, 829 µg/g DW, was the highest found in the study area.

Total PCBs

- Total PCBs concentrations were highest at Station SC-07 (15.0 µg/g DW), and also elevated at SC-04, SC-05, and SC-06 (> 5 µg/g DW) (Figure 5.29).

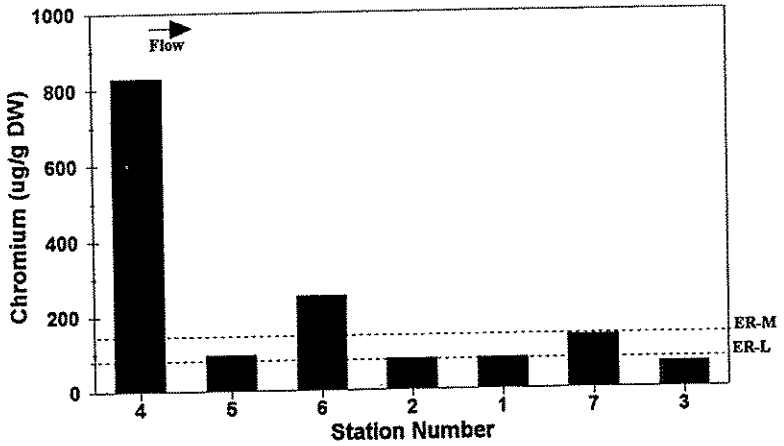

Figure 5.26. Swan Creek Longitudinal Profile of Lead

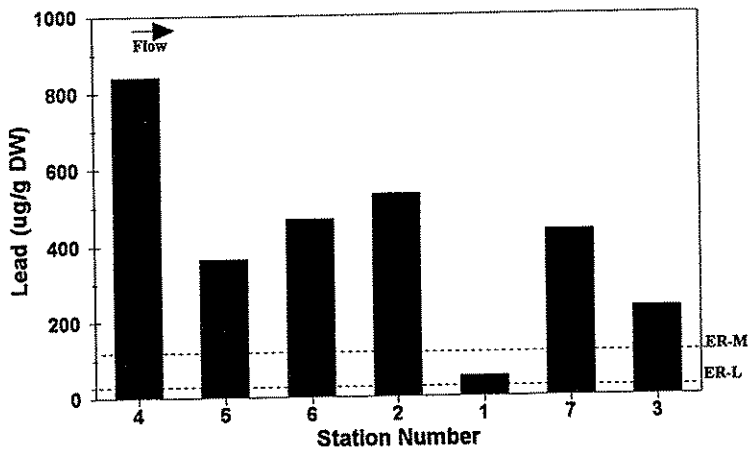

Figure 5.27. Swan Creek Longitudinal Profile of Nickel

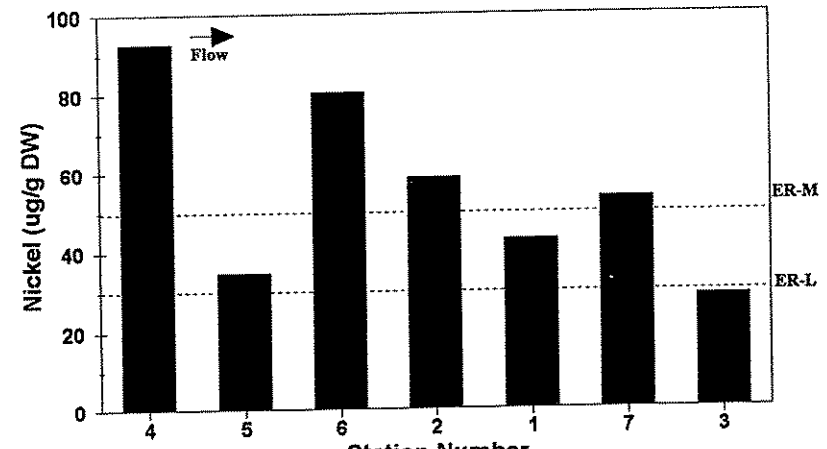

Figure 5.28. Swan Creek Longitudinal Profile of Zinc (ug/g DW)

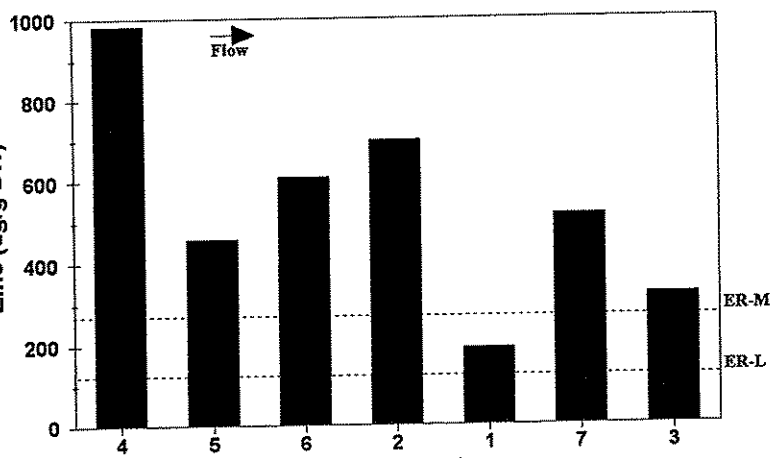

Total PAHs

- In contrast to total PCBs, total PAH concentrations were highest at stations SC-02 and SC-03 (~20 µg/g DW), though all seven concentrations were below the ER-M (35 µg/g DW) (Figure 5.30).

5.2.6 Maumee Bay Surficial Sediments

A total of 53 stations were sampled in Maumee Bay; 45 in the Western Bay (i.e., west of the combined disposal facility [CDF] near the mouth of the Maumee River) and 8 in the Eastern Bay. This is less than half of the potential station locations identified in the project work plan using the U.S. EPA EMAP sampling grid. Nonetheless, several consistent contaminant distribution patterns are evident in the data plots (Figures 5.31 through 5.36).

Metals, Total PCBs, and Total PAHs

- In general, surficial sediment in the inner Western Bay and in the tributaries entering the northwestern corner of the Western Bay were more contaminated than surficial sediments in the outer Western Bay or most of the Eastern Bay.
- Contaminant concentrations were generally highest (usually > ER-L, sometimes > ER-M) near the mouth of the Maumee River, especially those stations nearest the river mouth and, secondarily, west of the CDF. This was true for all four metals, total PCBs, and total PAHs.
- Other areas exhibiting consistently elevated contaminant concentrations were (a) several stations off the mouth of the Ottawa River (lead, nickel, zinc, and PCBs); (b) a few stations in Shantee Creek (chromium, lead, nickel, and zinc); and (c) stations in Hooper Run (lead, nickel, zinc, and PCBs). Most of the elevated contaminant concentrations at these three locations exceeded the ER-Ls but not the ER-Ms for the listed contaminants. Exceptions were nickel, where the surficial sediments at three stations in Shantee Creek exceeded the ER-M, and total PCBs, where every detectable concentration exceeded the ER-M of 0.40 µg/g DW.

5.3. Vertical Distributions of Contaminants in Sediment Cores

The vertical distribution of contaminants in the sediment cores is important for several reasons:

- Normal sediment resuspension, due to storms, boat traffic, etc., can expose subsurface sediment layers which may be more contaminated than the current surficial sediment.
- It is necessary to know the volume of contaminated material at a location undergoing remedial activities, especially dredging.
- It is desirable to know the characteristics of the material exposed by dredging activities.

The following text describes just those cores from which at least 2 subsamples were collected, and emphasizes (a) the vertical distribution patterns of the contaminants and (b) the location of the highest contaminant concentrations in each area.

5.3.1. Duck Creek Sediment Cores

Seven cores were collected from the lower 100' of Duck Creek. One core consisted of a single surficial sample. They ranged from 14" to 77" in length, and averaged 44" long. Their composition was fairly consistent: surficial sediment in 6 of 7 cores was silt; the intermediate subsurface layers in most cores was a mix of silt and sand; and 5 of 7 cores ended in sand or silty sand. Oil was not noted in any core.

Metals

- Metal concentrations decreased with depth in most of the cores (Figure 5.37); 4 of 6 cores for chromium, lead, and zinc, and 3 of 6 for nickel.
- Nickel exceeded its ER-M (50 µg/g DW) most often, in 69% of the samples. The other metals did not exceed their ER-Ms in more than 20% of the samples.
- The 65"-77" layer from station DC-03 contained Duck Creek's highest concentrations of chromium (172 µg/g DW), lead (83.3 µg/g DW), nickel (113 µg/g DW), and zinc (355 µg/g DW). The 0"-24" layer at this station also contained 353 µg/g DW of zinc.

Total PCBs

- PCB concentrations decreased with depth in 4 of 6 cores (Figure 5.38), and increased with depth in the other 2.
- PCB concentrations exceeded the ER-M value of 0.40 µg/g DW in 94% of the samples.
- Highest PCB concentrations in Duck Creek, 6 - 7 µg/g DW, were found in the 36"-56" layer at station DC-04 and in the 0"-24" layer at station DC-05.

Total PAHs

- PAH concentrations in the cores decreased with depth in 3 of 6 cores (Figure 5.39); increased with depth in 2 of 6 cores (Figure 5.40); and were similar with depth in one core.
- No sample exceeded the PAH ER-M value of 35 µg/g DW.
- The highest PAH concentration in Duck Creek, 16.7 µg/g DW, occurred in the 0"-24" layer at station DC-05. This sample also contained the highest PCB concentration in Duck Creek.

5.3.2. Maumee River Sediment Cores

Fifty-nine cores were collected from the lower 7.5 miles of the Maumee River. They ranged in length from 11" to 108", and averaged 55" long. Their composition was fairly

Figure 5.37. Duck Creek Core Profile of Nickel at Station DC02

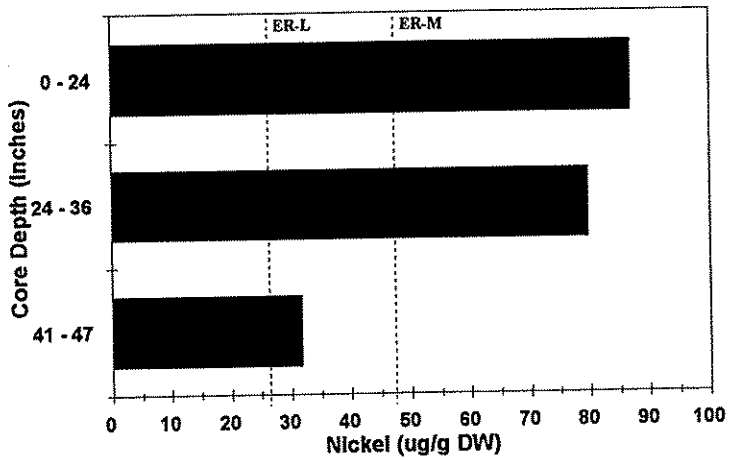

Figure 5.38. Duck Creek Core Profile of Total PCBs at Station DC02

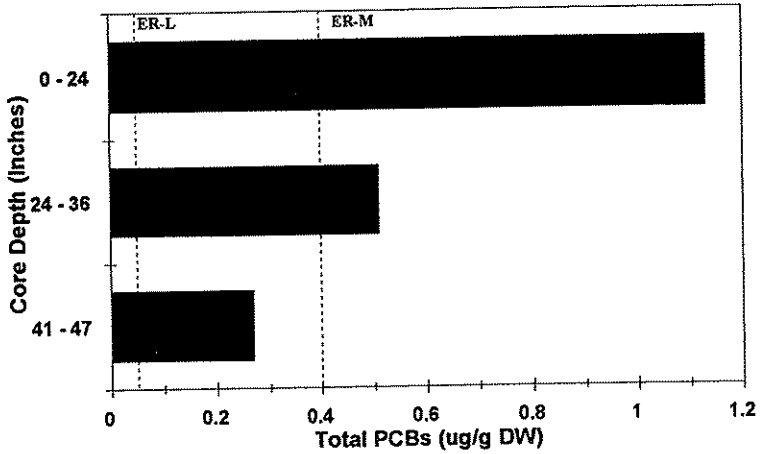

Figure 5.39. Duck Creek Core Profile of Total PAHs at Station DC05

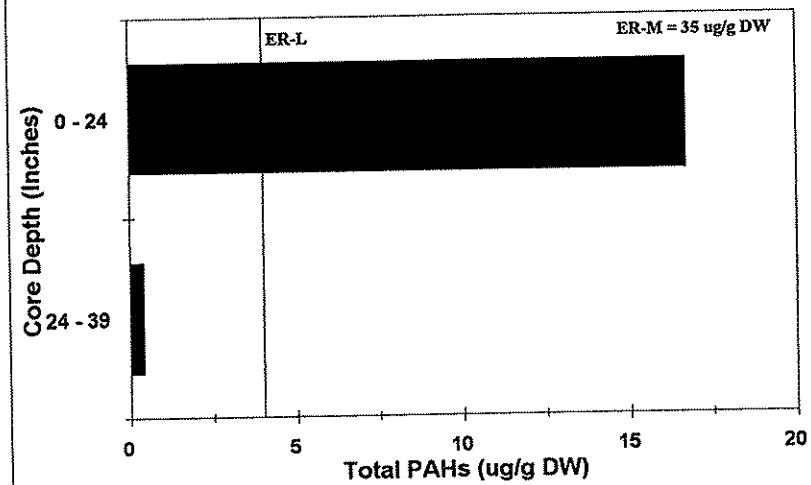

Figure 5.40. Duck Creek Core Profile of Total PAHs at Station DC04

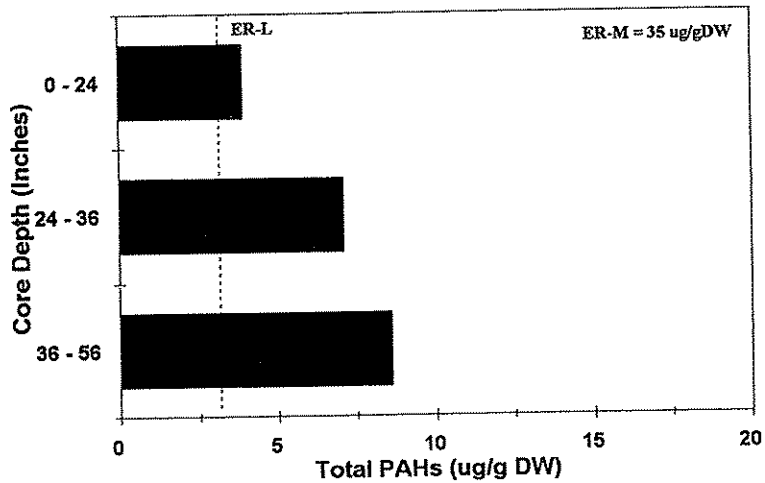

consistent: the surficial sediment in all 59 cores was silt, and in only 6 cores was this silt oily; intermediate sediment layers were generally silt; and most cores ended in clay (30 of 59) or silt (25 of 59). Four cores ended in sand. Ten cores ended in oily material. Some subsurface layers were intermingled with sand, oil, shells, wood, or aggregate (small gravel). Three subsurface layers were also noted to contain coal tar.

Metals

- Vertical distributions of metals exhibited several patterns: (1) high concentrations throughout the core, especially in a subsurface layer (20% of the cores); (2) high concentrations in a subsurface layer, in a core that is otherwise clean (a single core); and (3) high concentrations in a subsurface layer, with decreasing concentrations lower in the core (34% of the cores).
- The first pattern is illustrated in Figure 5.41; zinc at station MR-49. Note that all of the sediment layers exceeded the ER-M value for zinc.
- The second pattern is illustrated in Figure 5.42; nickel at MR-49. This pattern occurred in just this core, which is near the Toledo Coke facility.
- The third pattern is illustrated in Figure 3.43; lead at MR-56. Note that the lead concentration in the lowest layer, 40"-60", approaches the ER-L value.
- Nickel exceeded its ER-M value more often than any other metal in the Maumee River cores, in 56% of the samples. The nickel concentration in the 42"-50" layer from core MR-49, 292 µg/g DW, was the highest found in the study area.
- One of the "minor" metals in this study (i.e., seldom exceeded its ER-M value) was arsenic, which exceeded its ER-M (85 µg/g DW) in just one sample; the 34.5"-42" layer in core MR-06, as shown below:

0"-24" = 19.3 µg/g DW
24"- 31" = 43.4 µg/g DW
34.5" - 42" = 117 µg/g DW.

Station MR-06 is located at the upstream boundary of the study area, on the right side of the river adjacent to the Libby-Owens-Ford Glass Company. It should be noted that arsenic trioxide (As_2O_3) is used as a decolorizing agent in glass making.

Total PCBs

- Total PCBs in the Maumee River cores exhibited four principal vertical distribution patterns: (1) decreasing concentrations with depth (32% of the cores); (2) increasing concentrations with depth (24%); (3) similar concentration with depth (20%); and (4) cores where the highest PCB concentration is found in a subsurface layer (18%; Figures 5.44 and 5.45).
- PCB concentrations exceeded the ER-M value of 0.40 µg/g DW in 92% of the samples. Concentrations exceeding 50 µg/g DW were found in subsurface layers at three locations; stations MR-31 and MR-32, near the Toledo Coke facility, and MR-19, near the Gulf Oil and Standard Oil facilities. Toledo Coke closed in 1992.

Figure 5.41. Maumee River Core Profile of Zinc at Station MR49

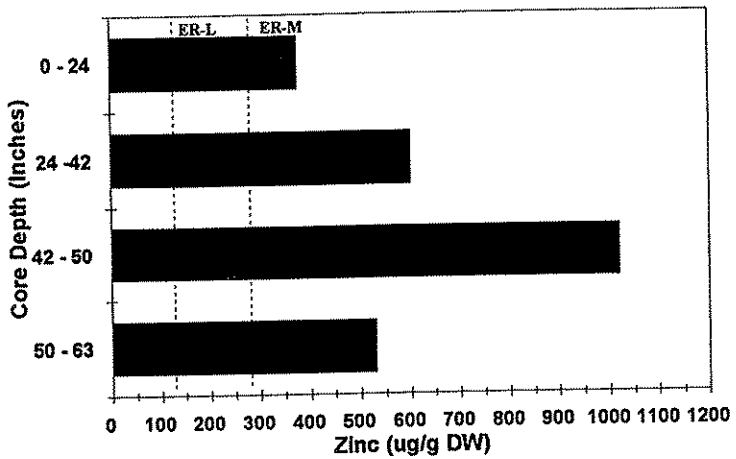

Figure 5.42. Maumee River Core Profile of Nickel at Station MR49

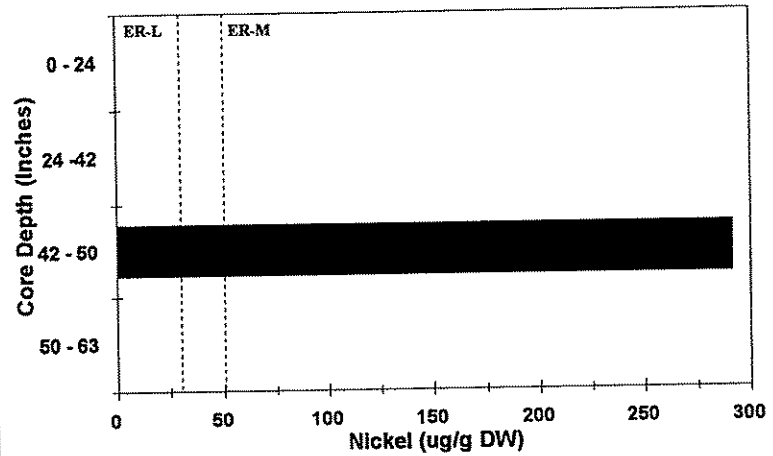

Figure 5.43. Maumee River Core Profile of Lead at Station MR56

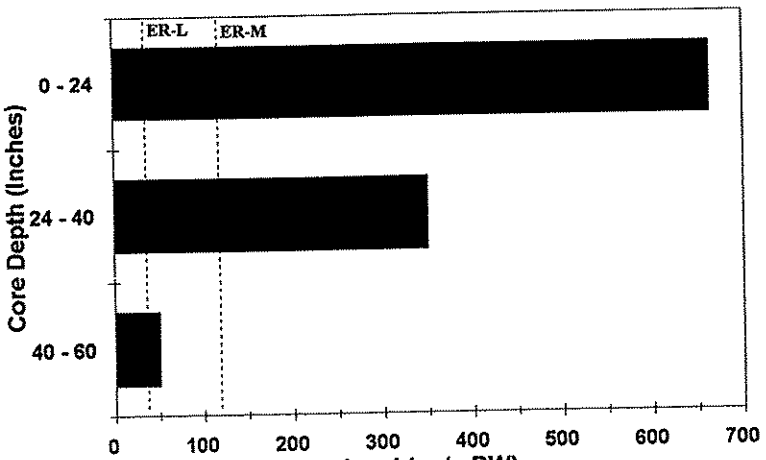

Figure 5.44. Maumee River Core Profile of Total PCBs at Station MR49

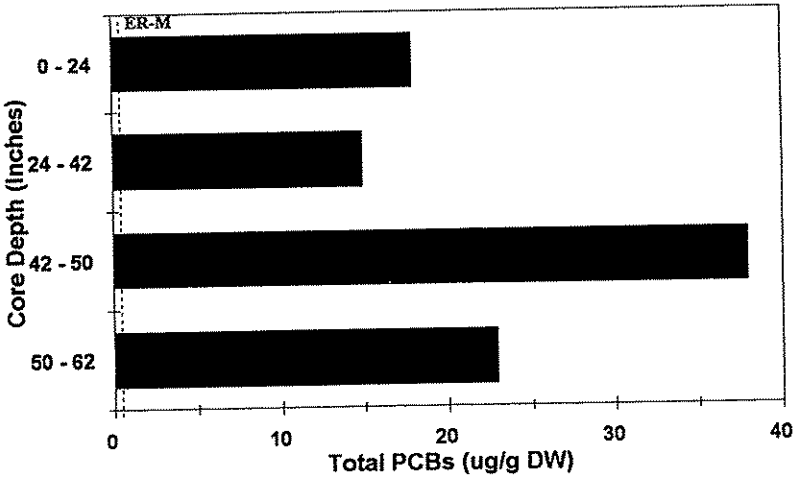

Total PAHs

- Like PCBs, total PAHs in the Maumee River cores exhibited four principal vertical distribution patterns: (1) decreasing concentration with depth (34% of the cores; Figure 3.46); (2) increasing concentration with depth (32%); (3) similar concentration with depth (16%); and (4) cores where the highest PAH concentration is in a subsurface layer (14%).
- PAH concentrations exceeded the ER-M value of 35 μg/g DW in only 6% of the samples. Very high PAH concentrations, exceeding 100 μg/g DW, were found in two cores; MR-11 and MR-12. These two stations are located near the Toledo Coke facility.

5.3.3. Ottawa River Sediment Cores

Nine cores were collected from the lower 1.5 miles of the Ottawa River. They ranged in length from 53" to 92", and averaged 72" long. Their composition was fairly consistent: the surficial sediment in all 9 cores was silt; most all of the subsurface layers in the cores was silt, sometimes mixed with fibrous material and/or shell fragments; and most ended in clay (5 of 9) or peat (2 of 9). Oily subsurface layers were noted in only 2 cores (OR-01 and OR-02), and only 1 core (OR-06) ended in oily material (oily clay).

Metals

- Metal concentrations decreased with depth in most of the Ottawa River cores (Figure 5.47); in 4 of 8 cores for chromium and nickel, and 7 of 8 cores for lead and zinc.
- Nickel exceeded its ER-M value more often than the other metals, in 58% of the samples.
- Highly contaminated (> ER-M values) surficial sediment (0"-24") were found at station OR-01 (chromium, zinc), OR-02 (chromium, nickel, zinc), and OR-06 (lead, zinc). In addition, the 24"-36" layer at station OR-02 was highly contaminated with chromium and zinc.

Total PCBs

- PCB concentrations in most of the cores either decreased with depth (4 of 9 cores; Figure 5.48) or were similar with depth (3 of 9 cores).
- All of the PCB concentrations measured exceeded the ER-M value of 0.40 μg/g DW, and the highest concentration was 8.56 μg/g DW, at station OR-08.

Total PAHs

- Most of the total PAH concentrations in the Ottawa River cores either decreased with depth (5 of 9; Figure 5.49) or were similar with depth (3 of 9).

Figure 5.45. Maumee River Core Profile of Total PCBs at Station MR32

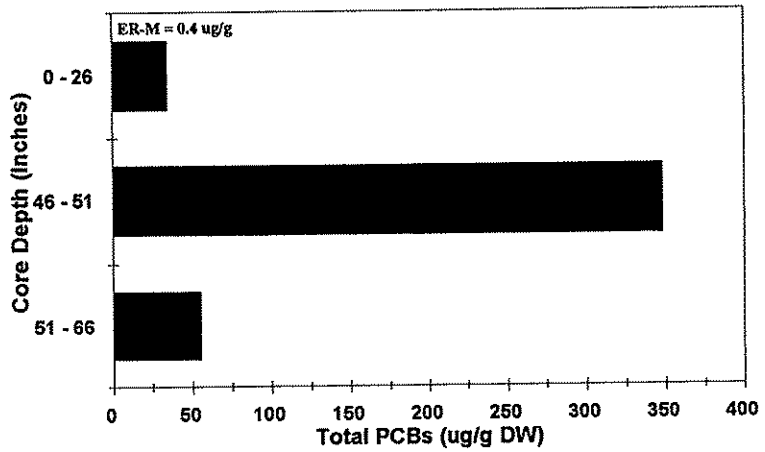

Figure 5.46. Maumee River Core Profile of Total PAHs at Station MR11

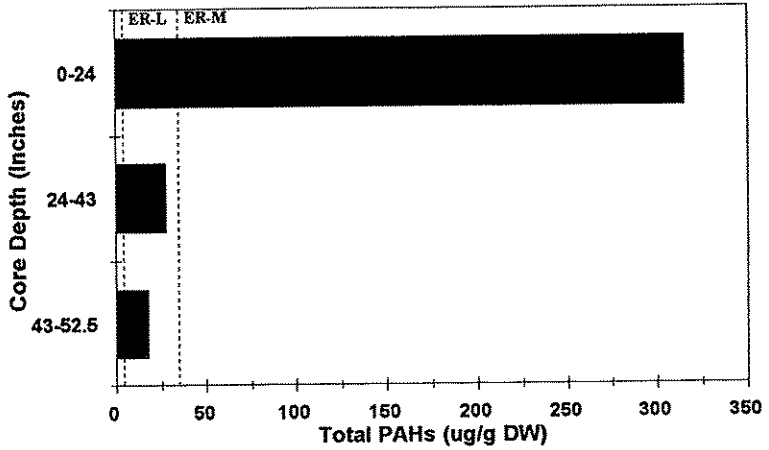

Figure 5.47. Ottawa River Core Profile of Zinc at Station OR01

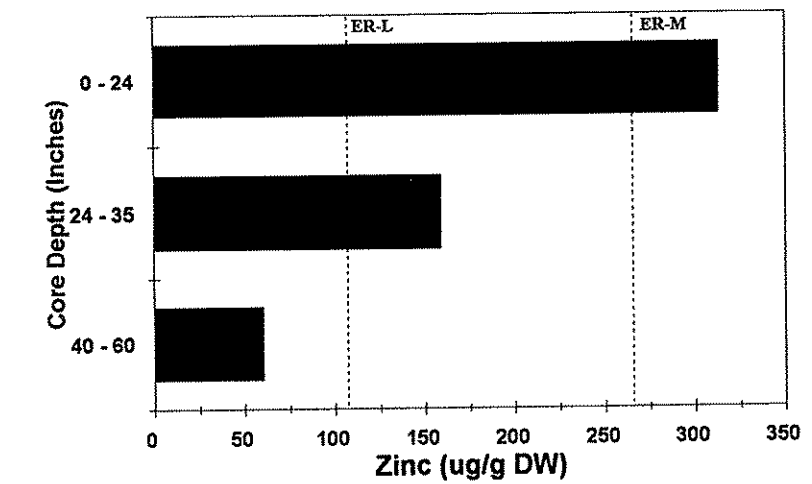

Figure 5.48. Ottawa River Core Profileof Total PCBs at Station OR07

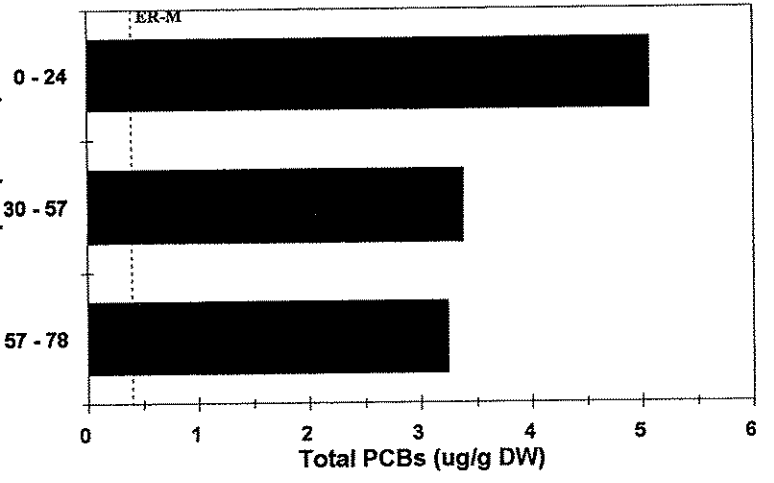

No sample exceeded the PAH ER-M of 35 µg/g DW, and most (62%) of the concentrations were between the ER-L and ER-M values. The highest measured concentration was 23.4 µg/g DW, at station OR-08.

5.3.4. Otter Creek Core Profiles

Twelve cores were collected from the lower 2,900 feet of Otter Creek, though only a single surficial sample was collected from one core (OC-03). They ranged from 8" to 70" in length, and averaged 54" long. Their composition was fairly consistent: surficial sediment in all 12 cores was silt; the intermediate subsurface material was usually dark silt; and most ended in clay, which often contained fibrous plant remains. The surficial sediment in 5 cores contained traces of oil, as did subsurface layers in 4 cores.

Metals

- Vertical distributions of the metals in the cores were variable. Concentrations of chromium and zinc generally decreased with depth, in 9 of 11 cores for each metal. Nickel concentrations decreased with depth in 3 of 11 cores, increased with depth in 3 of 11 cores, and exhibited other distribution patterns in the remaining cores. Lead concentrations decreased with depth in 5 of 11 cores, increased with depth in 3 of 11 cores, and exhibited other distribution patterns in the remaining cores. Figures 5.50 and 5.51 illustrate the decreases-with-depth distribution pattern.
- Chromium and lead were the metals which most often exceeded their ER-M values in the Otter Creek cores, in 46% and 43% of the samples, respectively. Exceptionally high lead concentrations, exceeding the ER-M value of 110 µg/g DW, were found in the surficial sediment at station OC-10 (1,240 µg/g DW; Figure 5.50) and in the 28"-34" layer at station OC-01 (989 µg/g DW). Both stations are in the downstream half of the area sampled.

Total PCBs

- PCB concentrations in the cores decreased with depth in 6 of 11 cores (Figure 5.52), and increased with depth in 3 others.
- PCB concentrations exceeded the ER-M value of 0.4 µg/g DW in 93% of the samples. An exceptionally high PCB concentration of 717 µg/g DW was found in the 28"-34" layer of core OC-01 (Figure 5.53). This was the highest PCB concentration found in the study area. This layer was also highly contaminated with lead and PAHs.

Total PAHs

- PAH concentrations in the core samples decreased with depth in 6 of 11 cores, were similar with depth in 2 cores, and exhibited a highly contaminated subsurface layer in 2 cores; OC-01 (Figure 5.54) and OC-02.

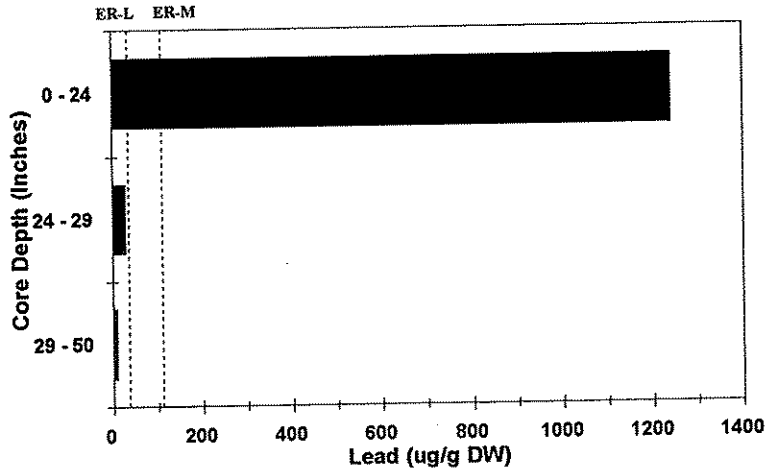

Figure 5.51. Otter Creek Core Profile of Chromium at Station OC10

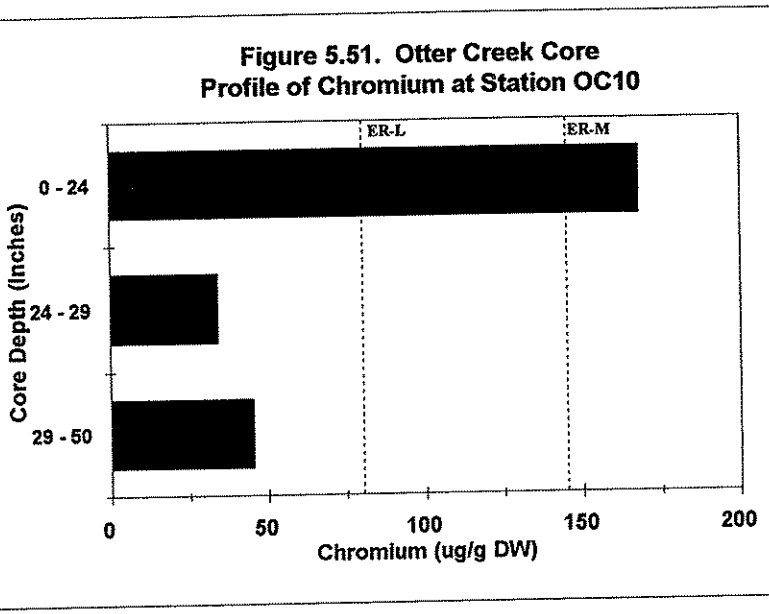

Figure 5.52. Otter Creek Core Profile of Total PCBs at Station OC10

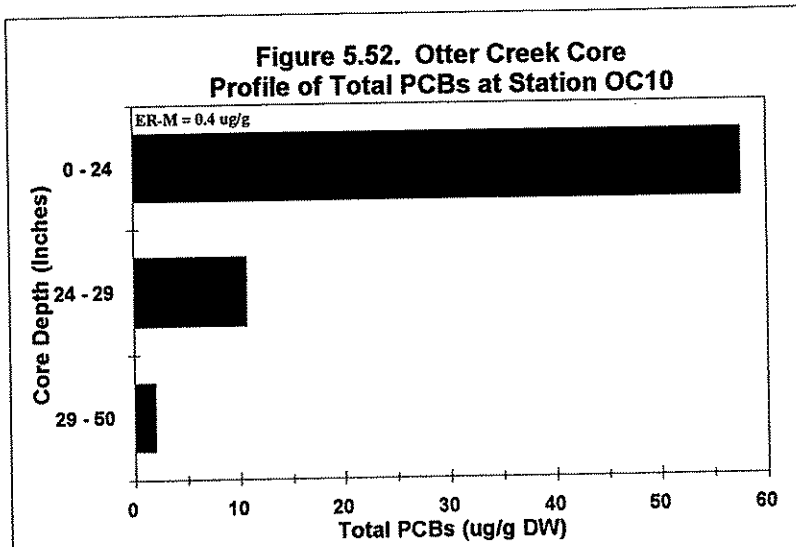

- PAH concentrations exceeded the ER-M value of 35 μg/g DW in only 7% of the samples. The highest PAH concentration found was 137 μg/g DW, in the 28"-34" layer of core OC-01. This layer was also highly contaminated with lead and PCBs.

5.3.5. Swan Creek Sediment Cores

Seven cores were collected from the lower 500 feet of Swan Creek. The cores ranged in length from 33" to 83", and averaged 65" long. Their composition was fairly consistent: the surficial sediment was silt in all seven cores; most (4 of 7) contained subsurface oily layers; and most (5 of 7) ended in dark oily clay. In general, the sediments in Swan Creek were the most contaminated sediments sampled in this study.

Metals

- Vertical distributions of metals in the cores were variable. Concentrations of chromium decreased with depth in 5 of 7 cores; concentrations of nickel were similar with depth in 4 of 7 cores and increased with depth in 3 cores; and lead and zinc concentrations were similar with depth in 4 cores (Figure 5.55).
- Most of the sediment samples were highly contaminated with metals, exceeding the ER-M values for lead (87% of the samples), nickel (57%), and zinc (87%). The chromium ER-M, in contrast, was exceeded in only 9% of the samples.
- The core from station SC-04 was especially contaminated with metals, containing Swan Creek's highest concentrations of chromium (829 μg/g DW, in the 0"-24" layer; Figure 5.56), lead (841 μg/g DW at 0"-24"), and zinc (1,150 μg/g DW at 0"-24" and 1,040 μg/g DW at 64"-81"). All of these values greatly exceeded the ER-Ms.

Total PCBs

- PCB concentrations increased with depth in most of the cores (4 of 7; Figure 5.57).
- Ninety-seven of the samples exceeded the ER-M for total PCBs (0.40 μg/g DW). The highest PCB concentrations in Swan Creek were around 15 μg/g DW, in several cores.

Total PAHs

- Total PAH concentrations either increased with depth (3 of 7 cores; Figure 5.58) or were similar with depth (3 of 7) in most of the cores.
- Seventeen percent of the samples exceeded the ER-M value of 35 μg/g DW, the highest proportion of any of the study areas (River, Bay, tributaries). Highest PAH concentrations were observed in the core from station SC-02; 87.4 μg/g DW in 35"-54" layer and 89.0 μg/g DW in the 54"-63" layer (Figure 5.58)

5.3.6. Maumee Bay Sediment Cores

Sediment in the 52 cores from the Eastern and Western Maumee Bay were generally quite similar. Eight Eastern Bay cores ranged from 9" to 66" in length, and averaged 33" long, while 44 Western Bay cores ranged from 11" to 68" in length, and averaged 35" long. Their composition was fairly consistent: surficial sediment in most cores (49 of 52, total) was silt; the intermediate subsurface layers in most of the cores was silt, occasionally mixed with shell fragments; and most (38 of 52) ended in silt or silty peat. Zebra mussel shells made up the upper 1" to 2" in two cores from the Western Bay. The sediment in most of these cores appeared to be clean: only one core contained oily surficial sediment; only three cores contained oily subsurface intermediate layers; and only one core was noted to exhibit a septic smell. No cores were noted to end in oily material.

On the whole, the sediments from Maumee Bay were the least contaminated of the study areas sampled (the River, Bay, and tributaries).

As elsewhere in the study area, not all of the cores collected in Maumee Bay were divided into multiple samples. Multiple samples were collected from cores at 28 of 52 stations (54%), and only surficial samples (usually 0"-24") were collected at the other stations. Most of the multi-sample cores exhibited similar vertical contaminant concentration profiles; contaminant concentrations usually decreased with depth. Specific examples are discussed below.

Metals

- Metal concentrations generally decreased with depth in the core (Figure 5.59); 64% of the cores for chromium, 71% for lead, 39% for nickel, and 68% for zinc.
- Metal concentrations increased with depth in a consistent percentage of the cores; 18% for chromium, lead, and zinc, and 21% for nickel. Nine cores (17%) exhibited increasing concentrations with depth for more than one contaminant (Table 5.3). These stations occurred in the inner bay, near the mouth of the Maumee River (6 stations), in the outer bay near Woodtick Peninsula (2 stations), and in Shantee Creek (1 station). These locations would be of special concern if dredged.
- On the whole, sediments from Maumee Bay contained the lowest concentrations of metals out of the study areas sampled. Nickel concentrations most often exceeded its ER-M (33% of the samples in the Eastern Bay and 27% of the samples in the Western Bay), while concentrations of the other three metals did not exceeded their ER-M values in more than 8% of the samples in either the Eastern or Western Bay (Table 5.2).
- Chromium concentrations never exceeded the ER-M value (145 μg/g DW), but samples from several cores in both the East and West Bay exceeded 100 μg/g DW. Only a single sample,; the surficial sediment at station WB-119, exceeded the lead ER-M of 110 μg/g DW (119 μg/g DW). The highest nickel concentrations (ER-M = 50 μg/g DW) were the 24"-34" layers in cores from WB-26 (111 μg/g DW) and WB-33

(118 µg/g DW). Highest zinc concentrations (ER-M = 270 µg/g DW) were in the core from WB-119; the 0"-24" layer = 293 µg/g DW, and 44"-56" = 368 µg/g DW.

Table 5.3.
Maumee Bay Stations Exhibiting Increasing Concentrations with Depth for Multiple Contaminants.

Station	Contaminants
EB-32	Pb, Zn
EB-41	PAHs, Cr, Pb, Zn
WB-16	Cr, Ni
WB-25	PAHs, Cr
WB-26	PAHs, PCBs, Ni
WB-101	PAHs, PCBs, Pb
WB-108	PAHs, PCBs, Pb
WB-111	Ni, Zn
WB-119	Ni, Pb, Zn

Total PCBs

- Most of the Maumee Bay cores exhibited similar concentrations with depth (39%; Figure 5.60) or decreasing concentration with depth (36%). PCB concentrations increased with depth in only 5 cores (18%).
- Eighty-four percent of the samples from the bay as a whole exceeded the PCB ER-M of 0.40 µg/g DW. On average PCB concentrations were lower in the Eastern Bay (25% > ER-M) than in the Western Bay (92% > ER-M).
- Only the surficial samples from two outer-bay cores; WB-107 and WB-114; contained PCB concentrations that exceeded 5 µg/g DW. Sediment layers in the remaining Maumee Bay cores generally contained less than 2 µg/g DW PCBs.

Total PAHs

- PAH concentrations decreased with depth in 43% of the Bay cores; were similar with depth in 21% of the cores; and increased with depth in 21% of the cores (Figure 5.61).
- Concentrations of total PAHs were generally low. Only 1% of the values from the Western Bay, and none of the Eastern Bay samples, exceeded the ER-M value (35 µg/g DW).
- One notable exception was the core at station WB-101, in the western lower bay, which contained 8.82 µg/g DW PAHs in the 0"-24" layer, and 211 µg/g DW in the 24"-30" layer.

5.4. Rank Scores of the Samples

Data for the six major contaminants were ranked from least contaminated (rank score = 1) to most contaminated (rank score = 100), and then averaged to produce an overall rank score for each sample. Table 5.4 lists the ten least contaminated samples and the ten most contaminated samples. Overall, the least contaminated area was the Western Maumee Bay and the most contaminated was Swan Creek (Table 5.5). Note that its average rank score was much higher than the next-most contaminated area, Otter Creek. The sample field sheets indicated that oil was observed in the samples of Swan Creek more often than elsewhere in the study area.

Table 5.4
Least and Most Contaminated Samples in the Maumee River AOC, by Rank Score

Least Contaminated	Rank Score		Most Contaminated	Rank Score
WB-18 25-39	1.43		SC-04 39-64 & SC-02 35-54	32.39
WB-118 34-37	1.61		MR-29 0-24	34.50
WB-23 0-17	1.65		MR-12 0-24	36.04
WB-73 24-36	1.69		MR-54 0-24	36.72
WB-03 24-30	1.76		MR-49 42-50	37.23
WB-114 31-38	1.82		MR-54 46-70	37.32
WB-118 29-34	2.03		MR-29 60-72	41.07
WB-107 46-53.5	2.20		OC-01 28-34	44.65
OR-05 0-24	2.26		SC-04 0-24	46.31
WB-19 24-33	2.34		MR-29 40-60	49.71

Table 5.5.
Average Rank Scores for Sub-areas along the Maumee River AOC

Area	Average Rank
Western Maumee Bay	5.82
Eastern Maumee Bay	6.34
Ottawa River	8.19
Duck Creek	8.86
Maumee River	12.27
Otter Creek	12.97
Swan Creek	20.85

Least Contaminated Samples

- Among the 10 least contaminated samples, only two (OR-05 0"-24" and WB-23 0"-17") were surficial. Station WB-23 had no subsurface samples collected. Additionally, half of these 10 least contaminated samples were collected from the lowest layer of a particular station (WB-18 25"-39", WB-118 34"-37", WB-03 24"-30", WB-114 31"-38", and WB-107 46"-53.5").
- Only sample OR-05 0"-24" was not from the Western Maumee Bay, but it was located right at the mouth of the Ottawa River, leading into the Western Maumee Bay (Refer to Appendix D for the complete sample rankings spreadsheet).

Most Contaminated Samples

- Four of the 11 most contaminated samples were surficial (MR-29 0"-24", MR-12 0"-24", MR-54 0"-24", and SC-04 0"-24"). The 11 most contaminated samples occurred in only 7 cores, the majority of which were found in the Maumee River itself. Stations SC-04 and MR-54 each had 2 layers that were among the most contaminated samples. Station MR-29 was the most contaminated station out of the entire AOC; all three layers from this core are listed in Table 5.4. Stations MR-29 and MR-54 are on the left side of the river near a sewage treatment plant, the Toledo Yacht Club, and an old shipyard and armory. Stations MR-49 and MR-12 are both near Toledo Coke.
- It should also be noted that the highest concentrations of chromium, nickel, zinc, and total PCBs in the entire Maumee River AOC were included in these 11 samples.

5.5. Correlation of the Screening Data vs. the Confirmatory Data

Comparison of screening (XRF and EIA) data and confirmatory data (AA and GC) were possible for eight elements (mostly metals), total PCBs, and total PAHs. Correlations were moderate to strong for the metals, and poor for the PCBs and PAHs. Results for each of the ten contaminants are described below. Note that:

- For unknown reasons, the confirmatory lab analyzed 19 samples for metals and 20 samples for PCBs and PAHs. The extra organics sample was WB-85.
- Results for one of the 19 confirmatory metals samples, SC-03, are plotted on the graphs but were not included in the correlation analyses. This sample contained unusually high concentrations of arsenic, lead, mercury, and zinc. The mineralogical matrix of the sample appears to be substantially different than the other samples - statistically, seems to be in a different "population" - and so it was excluded from the linear regressions for the metals.

5.5.1 XRF Metals Data Confirmations

- The XRF data for arsenic exhibited an unexpected negative bias compared to the confirmatory data (Figure 5.62). This may have been due to the moderate concentrations of lead present in the samples, since the fluorescence peak of lead can

partly obscure the arsenic peak. The confirmatory:XRF correlation was only moderately strong ($r^2 = 0.66$). However, from a practical standpoint the two data sets are equivalent; all but one sample was below the ER-L value (33 µg/g DW) in both data sets, and that one sample exceeded the ER-L in both data sets.

- The XRF data for barium exhibited a positive bias compared to the confirmatory data, and a poor correlation ($r^2 = 0.091$; Figure 5.63). Barium is associated with the mineralogical matrix of the sample, however, as opposed to being an environmental contaminant adsorbed to the outside of the sediment particles. Consequently, its release from sediment during the acid digestion of the confirmatory analysis can be variable, which would result in a poor correlation to the "total" barium values produced by XRF. There are no Long and Morgan sediment quality guideline values for barium.
- The XRF data for cadmium exhibited a positive bias, and a poor correlation to the confirmatory data ($r^2 = 0.004$; Figure 5.64). The poor correlation is due to the low concentrations; only one sample exceeded the XRF Method Quantitation Limit. However, from a practical standpoint the two data sets are equivalent; all of the cadmium values were below the ER-M value (9 µg/g DW) in both data sets, and only one sample exhibited an XRF value exceeding the ER-L (5 µg/g DW) when the confirmatory value was less than the ER-L.
- XRF data for chromium exhibited a positive bias, and a strong correlation to the confirmatory data ($r^2 = 0.004$; Figure 5.65). Overall the XRF data were "conservative" when they did not agree with the confirmatory data; they indicate a greater probability for toxic effects than the confirmatory data. Seventeen of 18 confirmatory values were below the ER-L (80 µg/g DW), while only 9 of 18 XRF values were less than the ER-L. Seven of the remaining XRF values were between the ER-L and the ER-M (145 µg/g DW), indicating the potential for moderate toxicity.
- The confirmatory:XRF correlation for copper was very strong ($r^2 = 0.90$; Figure 5.66), and the two data sets were practically equivalent: copper concentrations in 13 of 18 samples were below the ER-L (70 µg/g DW) in both data sets, and 3 of 18 samples were between the ER-L and ER-M (390 µg/g DW) in both data sets. No sample exceeded the ER-M in either data set.
- The confirmatory:XRF correlation for iron was moderately strong ($r^2 = 0.68$; Figure 5.67), and the XRF data exhibited a positive bias. The moderately strong correlation was probably due to the limited range of iron concentrations in these samples (1.5% to 2.5% DW). There are no Long and Morgan sediment quality guidelines for iron.
- The correlations for lead and zinc were very strong ($r^2 = 0.96$ for each; Figures 5.68 and 5.69), partly due to a single, highly contaminated sample. The two data sets are essentially identical for both lead and zinc; both identified the same few samples as nontoxic (< ER-L values), another few samples as highly contaminated (> ER-Ms), and the remaining samples as moderately contaminated.

5.5.2. EIA Organic Contaminant Data Confirmations - PCBs and PAHs.

- Agreement between the EIA data and the confirmatory data for total PCBs was mixed. The correlation between the two data sets was very poor ($r^2 = 0.007$) for two reasons:

Figure 5.62. Correlation of XRF Data vs. Confirmatory Data for Arsenic

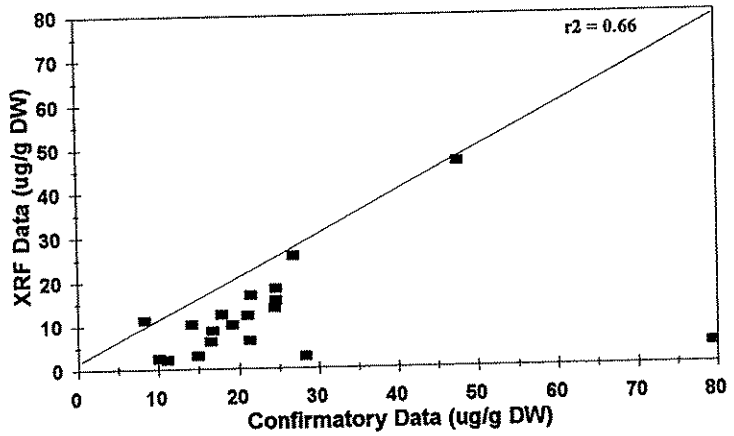

Figure 5.63. Correlation of XRF Data vs. Confirmatory Data for Barium

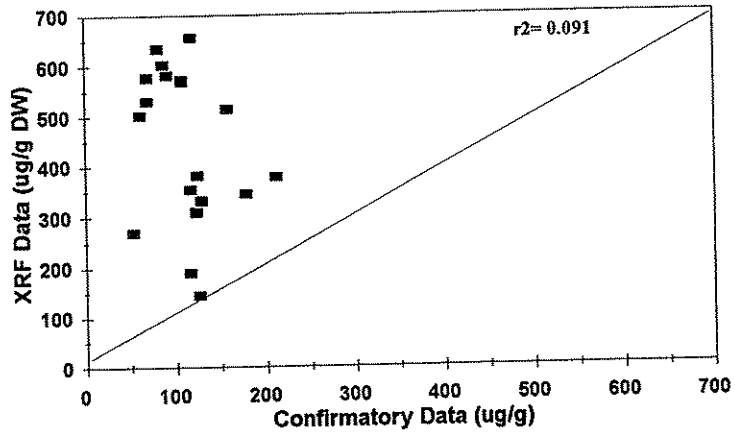

Figure 5.64. Correlation of XRF Data vs. Confirmatory Data for Cadmium

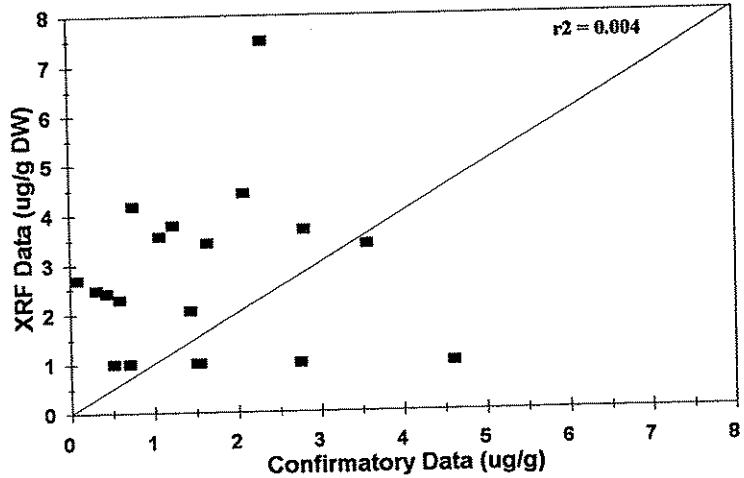

Figure 5.65. Correlation of XRF Data vs. Confirmatory Data for Chromium

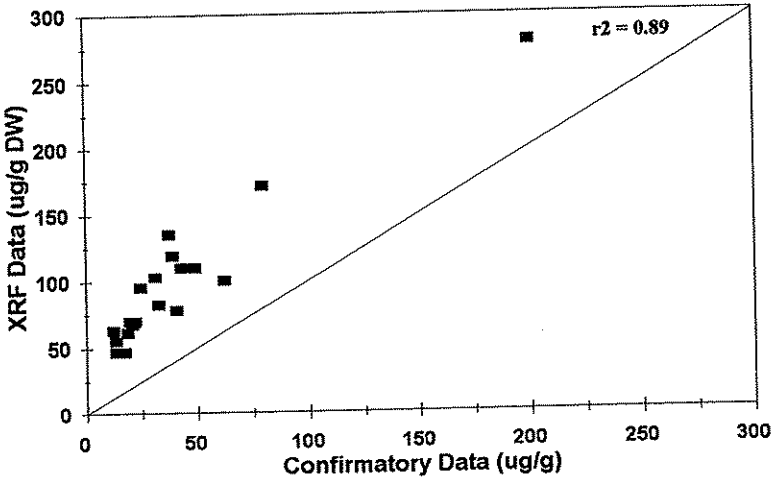

Figure 5.66. Correlation of XRF Data vs. Confirmatory Data for Copper

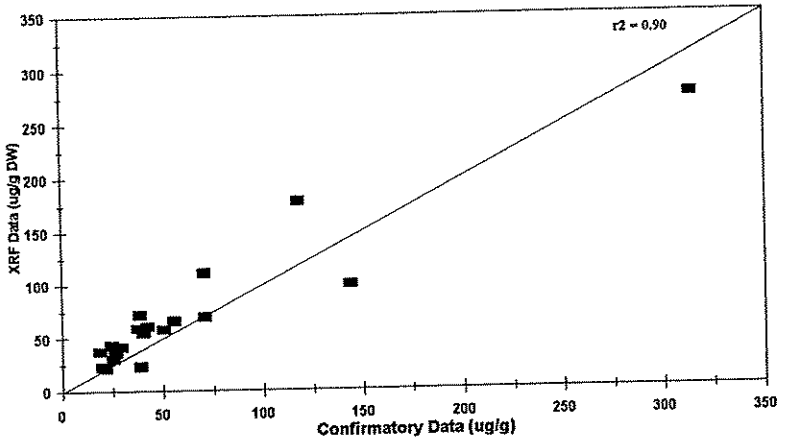

Figure 5.67. Correlation of XRF Data vs. Confirmatory Data for Iron

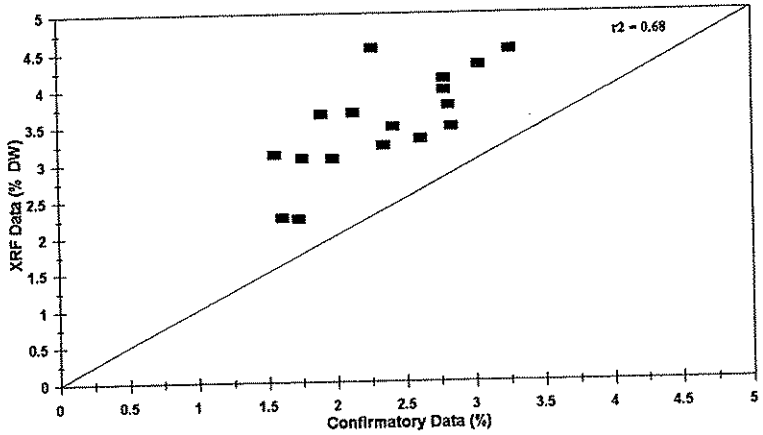

Figure 5.68. Correlation of XRF Data vs. Confirmatory Data for Lead

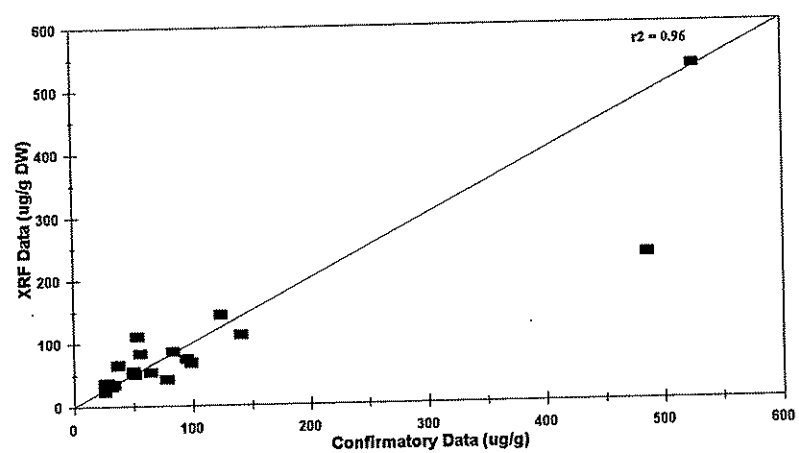

Figure 5.69. Correlation of XRF Data vs. Confirmatory Data for Zinc

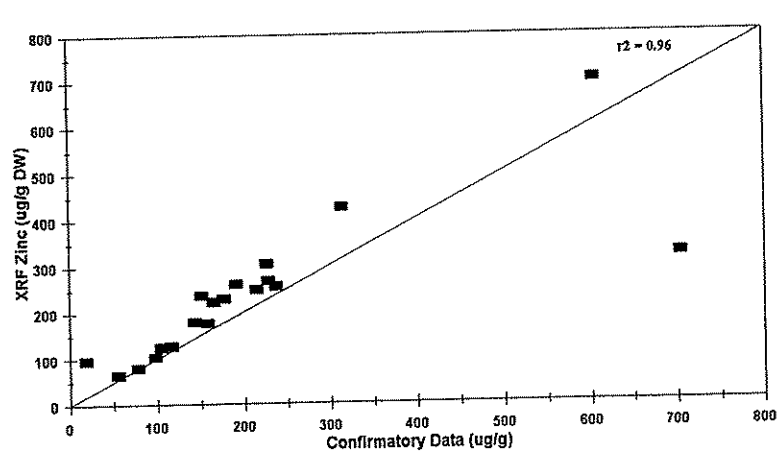

(1) PCB concentrations were similar and low, approaching the Method Quantitation Limit of the PCB EIA, and (2) the EIA concentration for a single sample (MR-11) was 27.4 μg/g DW while it was only 0.095 μg/g DW by GC. This particular sample contained an exceptionally high concentration of naphthalene (4,520 μg/g DW) and other PAHs, however, which may have affected the performance of the PCB EIA analysis. (Samples containing higher total PCB concentrations by EIA (≥ 50 μg/g DW) were found in several sediment samples collected in 1996, but none were sent for confirmation analysis.) Nonetheless, PCB concentrations were in generally good agreement except for sample MR-11; 17 of 19 values were less than 5 μg/g DW in both data sets (Figure 5.70). These conflicting observations; poor statistical correlation due to a small concentration range, but good general agreement with only one "outlier" value, make it difficult to judge the performance of the PCB EIA screening analysis. In several previous sediment assessment projects, however, PCB EIA data correlated well with confirmatory GC data (Rathbun et al., 1996). Consequently, the PCB EIA data generated in this study are probably reliable screening-level data.

- Agreement between the EIA data and the confirmatory data for PAHs was very poor ($r^2 = 0.10$; Figure 5.71). The PAH EIA analysis appeared to be very insensitive to changing PAH concentrations, which ranged up to 6,135 μg/g DW according to the confirmatory GC data. The reason(s) for the poor performance of the PAH EIA analysis is unknown, and calls into question all of the PAH screening-level data reported here.
- A relatively rapid, inexpensive screening analysis for total PAHs is still a desirable tool, however, and investigation of other techniques (e.g., UV spectroscopy) might be worthwhile.

Screening Analysis Results:

Total PCBs by Enzyme Immunoassay

Sediment Screening Survey
COMPLETE DATA SET FOR TOTAL PCBs ENZYME IMMUNOASSAYS ANALYSES

AScI Corporation (ESD); 30427 West Eight Mile Road, Livonia, MI 48152

ACKNOWLEDGEMENTS

This document was prepared by Terry Bosko, Andrea Crumpacker, Dr. Brian Mastin, PhD, Natalie Wojdakowski, and Alexandra Clark of Weston Solutions, Inc. (WESTON®), under United States Environmental Protection Agency (U.S. EPA) Contract No. EP-S5-06-04. This document was prepared under the direction of Brenda Jones and Ajit Vaidya, Project Leads, U.S. EPA Great Lakes National Program Office (GLNPO). We gratefully acknowledge the assistance of Joe Bonham, boat captain of the U.S. EPA Research Vessel (*R/V*) *MudPuppy 2;* and the City of Toledo Water Reclamation Department. Other personnel involved in the project included Dr. David Moore, Ph.D., Tonya Balla, and Lisa Graczyk of WESTON.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

EXECUTIVE SUMMARY

Weston Solutions, Inc. (WESTON®) has prepared this data evaluation report for sediment investigation activities performed within the confluences of Duck and Otter Creeks with the Maumee River in Toledo, Lucas County, Ohio. This report summarizes the investigation tasks, sample analyses, sample results, and evaluates the lines of evidence applicable to determining contaminants of concern for identifying future remedial needs.

The biological communities of Duck and Otter Creeks have been identified as impaired in the Maumee River AOC. These creeks and others in the region were modified during the draining of the Great Black Swamp in the late Nineteenth Century, and have had a complex history of urban industrial and residential land uses. Previous investigations have determined that several chemical constituents are present in the sediments of these creeks at concentrations that exceed benchmarks for aquatic life.

Based on previous studies, it was not possible to fully determine the extent to which the physical stressors resulting from habitat modification and the chemical stressors resulting from contamination were contributing to the biological impairments unless additional data was collected. The United States Environmental Protection Agency (U.S. EPA) Great Lakes National Program Office (GLNPO) and The Duck and Otter Creek Industrial Partners identified several data gaps for these creeks and entered into a project agreement under the Great Lakes Legacy Act (GLLA) to conduct an investigation. The data gaps field investigation was completed in 2010 and consisted of the following:

- Collection of surface sediment for chemical analyses and toxicity testing
- Collection of subsurface sediment for chemical analyses
- Habitat evaluation
- Benthic macroinvertebrates taxonomic identification study
- Collection of benthic macroinvertebrate tissue for chemical analyses
- Collection of fish tissue for chemical analyses (as collected by the U.S. Fish and Wildlife Service)

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

U.S. EPA GLNPO also acknowledged previous studies did not include evaluation of potential contaminant conditions in the confluence of Duck and Otter Creeks with the Maumee River, resulting in additional data gaps. Therefore, U.S. EPA GLNPO determined a sediment investigation was necessary in the confluence areas, concurrent with the 2010 data gaps investigation.

The U.S. EPA objectives for the confluence sampling were to:

- Determine the extent of contamination in both surface and subsurface sediments
- Further evaluate sediment toxicity and identify cause(s), to the extent practicable
- Collect data to support development of a Feasibility Study (FS) (evaluation of remedial and restoration options to protect human health and the environment and to advance progress toward delisting of beneficial use impairments), if one is found to be necessary

The confluence sampling was conducted during two sampling events: November 2010 and May 2011. The field sampling teams collected sediment samples from a total of 31 Vibracore and Ponar sampling locations (11 from Duck Creek and 20 from Otter Creek) during the two sampling events. A total of 103 samples (not including duplicates and field split samples) were collected from the 31 sampling locations. Surface sediment samples were analyzed for polychlorinated biphenyls (PCB), acid volatile sulfide/simultaneously extracted metals (AVS/SEM), 34 polycyclic aromatic hydrocarbons (34 PAH), semivolatile organic compounds (SVOC), metals, total organic carbon (TOC), and grain size distribution. Pore water (collected as sediment) was also analyzed from each surface sample location for metals, 34 PAHs, dissolved organic carbon (DOC), pH, hardness, and ammonia. Subsurface samples were analyzed for SVOCs, TOC, PCBs, and metals. A subset of the surface samples was also tested for toxicity using *Chironomus dilutus* (*C. dilutus*) for a 10-day exposure period.

Data Evaluation

Evaluation of the Duck and Otter Creeks confluence chemical data included comparison of contaminants in sediment and pore water to established probable effect concentrations (PEC) and other available benchmarks. For mixtures of compounds such as PAHs, PCBs and AVS/SEM divalent metals, WESTON calculated sediment quality metrics including mean probable effect

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

concentration quotients (PEC-Q) and equilibrium partitioning sediment benchmarks (ESB). These metrics results were compared to established thresholds for predicting adverse biological effects in sediment.

Weight of Evidence Evaluation

A weight-of-evidence evaluation was conducted to further determine the contaminants of concern in the confluence of Otter Creek. The evaluation focused on the sediments of the Otter Creek confluence as toxicity was observed in only one of eight Duck Creek confluence sediments; and wide-spread concentrations above individual PECs and PEC-Qs were limited to PCBs that were in deeper subsurface sediment. The evaluation included comparison of observed toxic effects to sediment quality metrics results and pore water benchmarks, performance of a Spearman-Rank Correlation Test to compare all chemical data to toxicity data, and plotting of correlation results.

Conclusions

The following are conclusions based on evaluation of the chemical and toxicity data collected from the Duck and Otter Creeks confluence during November 2010 and May 2011:

Duck Creek Confluence

PCBs are identified as the primary contaminant of concern in the confluence of Duck Creek based on the wide-spread incidence of concentrations over the total PCB PEC and the PEC-Q_{PCB}. The vertical extent of PCB contamination in the Duck Creek confluence has not been defined as PEC and PEC-Q_{PCB} exeedances were present in the deepest sampling intervals of DC-13, DC-16, DC-17, and DC-19. The horizontal extent of contamination is potentially defined to the north at DC-14; however, there were no additional samples to the north. PCB concentrations above the PEC of 676 micrograms per kilogram (µg/kg) ranged from 860 µg/kg at DC-13-03 to 6,500 µg/kg at DC-17-05.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Although the distribution of elevated PCB concentrations is wide-spread in the Duck Creek confluence, there are no incidences of elevated PCB concentrations in the shallow sediment (0 to 6 inches). The highest concentrations occur at 24 inches below sediment surface (bss) or deeper and in many cases, concentrations increase with depth. This concentration stratification indicates PCBs are most likely not available to the benthic community. Further, toxicity was observed in only one of eight sediment samples (DC-25) that is most proximal to the mouth of Duck Creek.

Otter Creek Confluence

PAHs are identified as the primary contaminant of concern in the confluence of Otter Creek based on the wide-spread incidence of concentrations over the total PAH PEC, the PEC-$Q_{PAH,}$ and the PAH equilibrium partitioning sediment benchmark toxic unit – final chronic value ($\sum ESBTU_{FCV}$) that are present in shallow sediment, as well as the sum of PAH Interstitial Water Toxic Unit ($\sum IWTU$) values above 1 in pore water. The vertical extent of PAH contamination in the Otter Creek confluence appears to be predominantly limited to the upper 24 inches of sediment; although locations OC-34, OC-44, and OC-45 contained elevated PAHs in the deepest sampling interval. However, in many cases, the sediment core retrieval was limited to two to three samples due to encountered refusal; and therefore the vertical extent of contamination may be defined by the substrate causing refusal below the available sediment.

The horizontal extent of PAH contamination appears defined to the west and northwest within the confluence at locations OC-33, OC-31, and OC-41. However, the horizontal extent is not defined to the north and northeast of locations OC-28, OC-29, and OC-32 between the mouth of Otter Creek and the boundary of the shipping channel.

Weight-of-Evidence

Toxic effects were observed for sediment sampling locations OC-26, OC-27, OC-30, OC-42, and OC-44 for both survival and growth. All samples resulted in PAH $\sum ESBTU_{FCV}$ values of greater than 5 and $\sum IWTU$ greater than 1, indicating a pattern of PAH $\sum ESBTU_{FCV}$ and $\sum IWTU$ values to predict toxicity for the Otter Creek confluence sediments.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

There are numerous PAHs negatively correlated to survival and growth, both in the sediment and pore water. Using a survival threshold proportion of 0.7, the correlation plots indicate a possible relationship between the reduction in proportional survival of *C. dilutus* at locations OC-26, OC-27, OC-29, OC-30, OC-42, and OC-44.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

1. INTRODUCTION

Weston Solutions, Inc. (WESTON®) has prepared this data evaluation report for sediment investigation activities performed within the confluences of Duck and Otter Creeks with the Maumee River in Toledo, Lucas County, Ohio. This report summarizes the investigation tasks, sample analyses, sample results, and evaluates the lines of evidence applicable to determining contaminants of concern for identifying future remedial needs.

All investigation activities were conducted in accordance with the *Quality Assurance Project Plan (QAPP) for the 2010 Duck & Otter Creeks Data Gaps Investigation* (WESTON 2010), the *Field Sampling Plan (FSP), Duck and Otter Creeks Confluence Investigation* (WESTON 2010), and subsequent three FSP and two QAPP addendums (WESTON 2010 and 2011). The investigation was conducted under the Superfund Technical Assistance and Response Team (START) contract, Technical Directive Document (TDD) No. S05-0008-1010-036, in response to a request from the United States Environmental Protection Agency (U.S. EPA) Region V Great Lakes National Program Office (GLNPO).

The following sections discuss the site description, site history and report organization.

1.1 SITE DESCRIPTION

Duck Creek (approximately 3.6 miles) and Otter Creek (approximately 9.5 miles) are urban creeks located in the cities of Toledo and Oregon, Ohio (**Figure 1-1**). Both creeks flow northward and ultimately discharge to the Maumee River, and are located within the Maumee River Area of Concern (AOC). However, there is a historically-observed seiche effect, whereby surface water backflows/rises in the creeks as a result of conditions in the Maumee River. The focus of this study consists of the most downstream portions and confluences of Duck and Otter Creeks with the Maumee River (**Figure 1-2)**.

The biological communities of Duck and Otter Creeks have been identified as impaired in the Maumee River AOC. These creeks and others in the region were modified during the draining of the Great Black Swamp in the late Nineteenth Century, and have had a complex history of

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

urban industrial and residential land uses. Previous investigations have determined that several chemical constituents are present in the sediments of these creeks at concentrations that exceed benchmarks for aquatic life.

1.2 SITE HISTORY

Previous studies completed by others include but are not limited to the following:

- Sediment Quality Assessment for Duck and Otter Creeks (ChemRisk, March 31, 1999)
- Investigations of industrial operations along Duck and Otter Creeks (PTRL 1997a and 1997b; ENVIRON and Mannik and Smith 2003)
- Spill reports prepared by the City of Oregon (City of Oregon 2003, 2004a, 2004b, 2005a, 2005b, and 2005c)
- Investigation of a release from the City of Toledo wastewater treatment plant lime sludge ponds (City of Toledo 1988)
- Investigations of Hecklinger Pond (BEC 1998, 2003, and 2004; ETC 1989; Ohio Environmental Protection Agency (OEPA) 2003b; TTL 1988; City of Toledo 1989a, 1989b, and 1991; and WSU 1991)
- Biological and Water Quality Study of the Portage River Basin, Select Lake Erie Tributaries, and Select Maumee River Tributaries, 2006-2008 (OEPA, 2010)
- Screening and Baseline Ecological Risk Assessment for Duck and Otter Creeks (Tetra Tech EM, Inc., December 21, 2008)
- Human Health Risk Assessment for Duck and Otter Creeks (Tetra Tech EM, Inc., December, 2008)
- Wetlands Identification and Restoration Plan for Duck and Otter Creeks Watersheds (Mannick & Smith Group)
- Duck and Otter Creeks Great Lakes Legacy Act Data Gaps Investigation (U.S. EPA GLNPO, Duck and Otter Creek Industrial Partners, 2010)

Many previous investigations at Duck and Otter Creeks have been conducted by the OEPA. The OEPA studies are typically part of an evaluation of the Maumee River AOC and include overall stream quality (OEPA 1994 and 1998, 1992 to 1998, and 1995; AScI 1997) and stream quality in the vicinity of specific disposal or industrial operations along Duck and Otter Creeks (OEPA1997a, 1997b, 1997c, and 1998).

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Sediment in Duck and Otter Creeks has been sampled at a number of locations over the past 18 years. Prior to 2007, analytes and sampling locations were highly variable, however. The results of studies and investigations conducted prior to 2007 were briefly summarized in a data gap analysis technical memorandum prepared by Tetra Tech EM Inc. (Tetra Tech 2005b). The technical memorandum identified likely chemicals of potential concern (COPC) for sediment and data gaps that were identified for the creeks. The data gaps identified included:

- The majority of data available for the creeks were more than 10 years old; and were of limited value because of the length of time since some were collected. The concern was that conditions may have changed significantly since those sediment samples were collected.
- Most sediment samples were analyzed using routine analytical techniques; however, some samples were analyzed using screening analytical procedures, such as immunoassay tests. A sediment quality assessment notes a poor correlation between results from the immunoassay tests and the fixed laboratory (ChemRisk 1999).
- More current data were needed, especially in the southern portions of the watershed.
- Limited chemical data were available on the sediments that would help evaluate the bioavailability of metals and contamination by non-polar organic compounds. The collection of data for acid volatile sulfide (AVS)/ simultaneously extracted divalent metal (SEM) and total organic carbon (TOC) analyses and whole sediment toxicity were recommended for the additional investigation by SulTRAC.

SulTRAC collected additional sediment samples at the site in April 2007 to address the data gaps identified above. Based on the April 2007 sediment data, SulTRAC concluded the following:

- Polycyclic aromatic hydrocarbons (PAH) and metals concentrations detected in samples collected from Duck Creek exceeded Ecological Risk Levels (ERL) and Human Health Risk Levels (HHRL) at locations throughout the length of Duck Creek.
- Individual polychlorinated biphenyl (PCB) Aroclor concentrations in samples collected from Duck Creek also exceeded HHRLs at the mouth of the creek and at the sampling locations in Hecklinger Pond; total PCB concentrations exceeded the ERL in exposure areas DC-A, DC-B, and DC-E.
- PAH and metals concentrations detected in samples collected from Otter Creek exceeded ERLs and HHRLs at locations throughout the length of the creek.
- Individual PCB Aroclor concentrations in samples collected from Otter Creek also exceeded HHRLs at several locations; total PCB concentrations exceeded the ERL throughout the length of the creek.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

- The highest total PAH concentrations detected in samples collected from Duck Creek were in the sediment sample collected from the east end of Hecklinger Pond.
- The highest total PAH concentrations detected in samples collected from Otter Creek were located in samples collected near Navarre Avenue, Pickle Road, and Oakdale Avenue, as well as other scattered locations.
- The highest total lead concentrations detected in samples collected from Duck Creek were located in a sample collected downstream (DC-04) and from the wetland area (DC-12). Cadmium, chromium, and mercury concentrations detected in DC-12 were also high. Arsenic exceeded its HHRL at all sampling locations. Additional metals exceedances of the ERLs and HHRLs were detected from samples located throughout the length of Duck Creek with no discernable trends.
- Metals exceedances, including arsenic, cadmium, chromium, lead and mercury, of the ERLs and HHRLs were detected from samples located throughout the length of Otter Creek with no discernable trends.
- A seiche effect (approximately 6-inch rise in water level) was observed during the sampling event on Otter Creek near location OC-04. Contaminated sediment may be transported upstream by this seiche effect.
- Toxicity was observed in eight of nine samples from Otter Creek; only the sample at the mouth of the creek did not exhibit toxicity greater than the control.
- For Duck Creek, toxicity was observed in only three of seven samples.
- The AVS/SEM data ratios were less than 1, indicating that sulfide concentrations in the sediment may be limiting the bioavailability of the metals in the sediments.
- There was no general trend of higher TOC or sediment percent solids values closer to the mouth of Otter Creek or Duck Creek than upstream, as may be expected with sedimentation of finer particles nearer the mouth of the creek where water velocity would be expected to be the slowest. Based on grain size analysis, a higher percent silt/clay content was more consistently found in the downstream samples collected in Otter Creek than the downstream samples collected in Duck Creek.

The Partners for Clean Streams implemented a two-phase human health and ecological risk assessment (HHRA/ERA) study for Duck and Otter Creeks. The overall purpose of the study was "to determine whether sediment contaminants pose a significant risk to human health or the environment, and if so, to identify specific chemicals contributing to toxicity and define the spatial extent (where risks are located) of risks (to human and ecological receptors)." As part of the assessment, a Tier 1 screening level ecological risk assessment (SLERA) for benthic receptors directly exposed to sediment and fish exposed to surface waters, and a Tier 2 Baseline

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Ecological Risk Assessment (BERA) for benthic macroinvertebrates and mammalian and avian receptors exposed indirectly to sediments in Duck and Otter Creeks were performed.

Tier 1 SLERA Results

To identify the COPCs, frequency of detection were reviewed and only compounds detected in 5% of the samples were used in the risk assessment. The following contaminants were identified as COPCs for Duck and Otter Creeks:

- Metals – Arsenic, barium, cadmium, chromium, copper, lead, manganese, mercury, selenium, and zinc
- Pesticides – Dichlorodiphenyltrichloroethane (DDT) and its metabolites, and heptachlor and its metabolites
- Total PCBs (Aroclor 1254 and 1260)
- PAH – 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3-c,d)pyrene, naphthalene, phenanthrene, pyrene, C1-chrysene/benzo(a)anthracene, C1-fluorenes, C1-fluoranthenes/pyrenes, C1-naphthalenes, C1-phenanthrenes/anthracenes, C2-chrysene/benzo(a)anthracene, C2-fluorenes, C2-naphthalenes, C2-phenanthrenes/anthracenes, C3-chrysene/benzo(a)anthracene, C3-fluorenes, C3-naphthalenes, C3-phenanthrenes/anthracenes, C4-chrysene/benzo(a)anthracene, C4-naphthalenes, and C4-phenanthrenes/anthracenes

HHRA Results

Data used for the final HHRA included (1) April 2007 sediment sampling data obtained from sampling Duck and Otter Creeks for the U.S. EPA GLNPO and (2) August and October 2007 sediment sampling data obtained from sampling Otter Creek in association with the Envirosafe Landfill. COPCs were identified using a conservative process that helped ensure no potentially significant chemicals were overlooked. COPCs identified for the final HHRA included: metals; volatile organic compounds; semivolatile organic compounds, including PAHs that are typically associated with incomplete combustion; pesticides; and PCBs.

The exposure assessment looked at where, how, and which people may be exposed to COPCs in Duck and Otter Creeks. Specifically, the exposure assessment examined the following:

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

- **Where:** Duck and Otter Creek were each divided into five different segments called exposure areas, and exposures were calculated for each area.
- **How:** The final HHRA looked at ingestion of and direct contact with sediment and ingestion of fish tissue. Fish ingestion was considered only in Hecklinger Pond, the upstream-most segment of Duck Creek (exposure area DC-E).
- **Who:** The final HHRA looked at adults, youths (age 7 to 18), and children (age 1 to 6). Because of security and reduced access, the children were not considered and a reduced exposure frequency was used for youths and adults for the most downstream segments of both creeks (exposure areas OC-A and DC-A).

Exposures were calculated using equations and input values recommended by U.S. EPA and OEPA. The input values were selected to generate a reasonable maximum exposure-that is, the highest reasonably expected exposure.

Risks represent the probability of an individual developing cancer. A risk of 1E-04 (or 1 x 10-4) represents 1 additional cancer in an exposed population of 10,000 people. Calculated risks were compared to EPA's acceptable risk range of 1E-06 to 1E-04. Risks were also compared to OEPA's statewide goal of 1E-05 for total additive carcinogenic risk. Hazards are calculated as a ratio of the calculated exposure and an acceptable exposure associated with no adverse effects. Hazards were compared to a value of 1, which represents OEPA's statewide goal for additive non-carcinogenic risk.

The results of the risk characterization are summarized as follows:

- All hazards associated with potential exposure to COPCs in sediment were less than 1.
- Risks calculated for all sediment exposure areas in both creeks exceeded U.S. EPA's point of departure (1E-06) in all exposure areas except for pathway and receptor-specific adult and youth dermal contact risks in exposure area OC-A, youth dermal contact risks in exposure area DC-A and child dermal contact risks in exposure area DC-C.
- Total risks associated with potential exposure to COPCs in sediment was lowest in the down stream-most exposure areas in each creek (DC-A and OC-A). Total risks (based on adult exposure only– children are assumed to have no exposure in these exposure areas) in DC-A (5E-06) and OC-A (2E-06) exceeded U.S. EPA's point of departure (1E-06), but were less than OEPA's statewide goal of 1E-05 for total additive risk.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

- Total risks (calculated as modified adult [adultmod] plus child risks) associated with potential exposure to COPCs in sediment equaled OEPA's statewide goal of 1E-05 for total additive risk in exposure areas DC-C and OC-B.
- Total risks (calculated as adultmod plus child risks) associated with potential exposure to COPCs in sediment exceed OEPA's statewide goal of 1E-05 for total additive risk, but were less than the upper end of EPA's acceptable risk range (1E-04) in exposure areas DC-B (2E-05), DC-D (3E-05), OC-C (2E-05), OC-D (5E-05), and OC-E (5E-05).
- Total risk (calculated as adultmod plus child risks) associated with potential exposure to COPCs in sediment exceeded the upper end of EPA's risk range (1E-04) in exposure area DC-E (2E-04).
- Sediment risks are driven primarily by potential exposure to PAHs in all exposure areas except DC-A and OC-A (primarily benzo[a]pyrene, as well as exposure to other carcinogenic PAHs) and arsenic (all exposure areas). Also, Aroclor-1254 was a risk driver in ES-4 exposure areas DC-E and OC-C, and Aroclor-1260, 4,4'-DDD, and 4,4'-DDE are risk drivers in exposure area DC-E.
- Total risks are lowest in the downstream-most exposure area in each creek (DC-A and OC-A) and increase toward the upstream exposure areas in each creek (DC-E and OC-E). This is due in part to reduced exposure frequencies assumed in the downstream-most exposure areas, but is primarily due to PAH concentrations that increase from downstream to upstream exposure areas in both creeks.
- Risks calculated for fish ingestion in Hecklinger Pond exceeded OEPA's statewide goal of 1E-05, as well as the high end of EPA's risk range of 1E-04. Adult, youth, and child risks were calculated as 8E-03, 3E-03, and 3E-03, respectively, for a total risk of 1E-02. These risks are driven by potential exposure to PAHs—particularly benzo(a)pyrene, and to a lesser extent to potential exposure to Aroclor-1254, Aroclor-1260, 4,4'-DDD, and 4,4'-DDE. The risks were not based on chemical concentrations measured in fish, but modeled from concentrations measured in sediments.
- Hazards associated with potential exposure to COPCs in fish tissue are greater than 1. Adult, youth, and child hazards were calculated.

2010 Data Gaps Investigation

Based on previous studies, it was not possible to fully determine the extent to which the physical stressors resulting from habitat modification and the chemical stressors resulting from contamination were contributing to the biological impairments unless additional data was collected. U.S. EPA GLNPO and The Duck and Otter Creek Industrial Partners identified several data gaps for these creeks and entered into a project agreement under the Great Lakes

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Legacy Act (GLLA) to conduct an investigation. The data gaps field investigation was completed in 2010 and consisted of the following:

- Collection of surface sediment for chemical analyses and toxicity testing
- Collection of subsurface sediment for chemical analyses
- Habitat evaluation
- Benthic macroinvertebrates taxonomic identification study
- Collection of benthic macroinvertebrate tissue for chemical analyses
- Collection of fish tissue for chemical analyses (as collected by the U.S. Fish and Wildlife Service)

At this time of this report, the data interpretation and reporting for the 2010 Data Gaps Investigation were on-going.

U.S. EPA GLNPO also acknowledged previous studies did not include evaluation of potential contaminant conditions in the confluence of Duck and Otter Creeks with the Maumee River, resulting in additional data gaps. Therefore, U.S. EPA GLNPO determined a sediment investigation was necessary in the confluence areas, concurrent with the 2010 Data Gaps Investigation.

1.3 PROJECT OBJECTIVES

The U.S. EPA objectives for the confluence sampling were to:

- Determine the extent of contamination in both surface and subsurface sediments
- Further evaluate sediment toxicity and identify cause(s), to the extent practicable
- Collect data to support development of a Feasibility Study (FS) (evaluation of remedial and restoration options to protect human health and the environment and to advance progress toward delisting of beneficial use impairments), if one is found to be necessary

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

1.4 REPORT ORGANIZATION

This report consists of the following sections:

- Executive Summary
- Section 1: Introduction
- Section 2: Study Area Investigation and Data Completeness
- Section 3: Analytical Results
- Section 4: Weight-of-Evidence Evaluation
- Section 5: Conclusions
- Section 6: References

Tables and figures are provided after Section 6 except for Sections 2 and 4, where some tables are embedded in text; and Section 4 where figures are embedded in text. In addition, this report contains the following appendices:

- Appendix A: Photographic Log
- Appendix B: Analytical Data
- Appendix C: Sediment Toxicity Test Reports
- Appendix D: Data Validation Reports

2. STUDY AREA INVESTIGATION AND DATA COMPLETENESS

This section discusses the sediment sampling and laboratory analysis of samples collected during the confluence investigation.

2.1 SEDIMENT INVESTIGATION

Sediment in the most downstream portions of both Duck and Otter Creeks and their confluence with the Maumee River were sampled for chemical analyses to determine the nature and extent of contamination.

Figures 2-1 and **2-2** show all the sediment sampling locations for the confluences of Duck and Otter Creek, respectively. Sediment sampling was completed during two sampling events in November 2010 and May 2011. The November 2010 sampling event was conducted using the research vessel *(R/V) Mudpuppy 2*. The May 2011 sampling event was conducted using a pontoon vessel equipped with a vibracore sampler operated by Affiliated Researchers so that

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

areas of shallow water could be accessed (previously inaccessible by the *R/V Mudpuppy 2* for sample collection). Depending on field conditions such as sediment thickness, various depth intervals were sampled at each location. **Table 2-1** presents the depth of water to the sediment surface, Vibracore sediment retrieval information, and the latitude and longitude for each sampling location. Representative photographs from the November 2010 and May 2011 sampling events are provided in **Appendix A**.

The sampling location strategy was to attempt to delineate the nature and extent of contamination, if present, at the confluence of each creek with Maumee Bay. The sampling locations proposed in the FSP and subsequent amendment were chosen to evaluate potential chemical contaminants spatially across the confluence areas while remaining south of the navigation channel that is routinely dredged. Adjustments to proposed locations were made in the field, as necessary, based on the availability of sufficient water depth and sediment depths.

The following sections discuss sediment sampling, sediment toxicity testing, data completeness, and QAPP data quality objectives.

2.1.1 Sediment Sampling

The field sampling teams collected sediment samples from a total of 31 Vibracore and Ponar sampling locations (11 from Duck Creek and 20 from Otter Creek).

The U.S. EPA's *R/V Mudpuppy 2* (November 2010) and Affiliated Researcher's pontoon vessel (May 2011) were used to deploy the Ponar and Vibracore samplers. A Ponar sampler was used to retrieve the upper 6 inches of sediment at each sampling location to collect sediment from the biologically active zone for toxicity testing and/or other chemical analyses. The Vibracore sampler was advanced to various sampling depths based a depth to refusal with up to seven samples collected from each core. These samples were sent to off-site laboratories for chemical analyses. A total of 103 samples (not including duplicates and field split samples) were collected from the 31 sampling locations. Subsection 2.2 discusses the laboratory analyses performed on each sample.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

All samples were collected in accordance with the methodologies and procedures discussed in the QAPP (WESTON 2010). While the QAPP was prepared for the 2010 Data Gaps Investigation GLLA project, it was formally adopted for the confluence investigation as the laboratory procedures and project personnel remained the same.

2.1.2 Sediment Toxicity Testing

The 10-day growth and survival tests for the midge *Chironomus dilutus (C. dilutus)* were used to evaluate sediment toxicity within the biologically active zone. Toxicity testing procedures followed U.S. EPA's "Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Fresh Water Invertebrates," Second Edition (U.S. EPA/600/R-99/064). Table 2-2 summarizes the sampling locations tested for toxicity that are also shown on **Figures 2-1 and 2-2**.

TABLE 2-2
SUMMARY OF SAMPLING LOCATIONS TESTED FOR TOXICITY

Duck Creek	Otter Creek
DC-13	OC-26
DC-14	OC-27
DC-16	OC-28
DC-17	OC-29
DC-19	OC-30
DC-22	OC-31
DC-23	OC-35
DC-25	OC-38
	OC-40
	OC-41
	OC-42
	OC-44
	OC-45
	OC-46

For solid-phase testing, eight replicates per sediment sample were set up for *C. dilutus* exposures. Test acceptability was based on greater than 70% survival for midges in the reference samples. Growth (weight gain) also indicated an acceptable test.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

2.1.3 Data Completeness

The FSP (WESTON 2010) completed for the November 2010 sampling event proposed eight sampling stations in the Duck Creek confluence and 18 in the Otter Creek confluence. However, a total of five stations were sampled for Duck Creek and eight stations were sampled for Otter Creek due to low water conditions making it difficult for the *R/V Mudpuppy 2* to access stations located in shallow water. The FSP Amendment #1 (April 2011) completed for the May 2011 sampling event proposed five to six sampling stations in the Duck Creek confluence and 10 to 12 sampling stations in the Otter Creek confluence. Samples from a total of six stations in the Duck Creek confluence and 12 in the Otter Creek confluence were collected. Samples collected from each location were analyzed for the parameters specified in the FSP (WESTON 2010) and using the laboratory protocols specified in the QAPP (WESTON 2010). All data were evaluated for usability and found to be usable. The data met and exceeded the 90% completeness goal established in the QAPP.

2.1.4 QAPP Data Quality Objectives

The data were compared to applicable sediment screening benchmarks as detailed in the data quality objectives portion of the QAPP (WESTON 2010). Section 3 of this report discusses the findings. In addition, Sections 3 and 4 of this report discuss the extent of contaminants in sediment above individual sediment screening benchmarks; the mean probable effect concentration (PEC) and PEC quotients (PEC-Q) for PAHs, metals, and PCBs; the equilibrium partitioning sediment benchmarks (ESB) and ESB toxic unit – final chronic value ($ESBTU_{FCV}$) for PAHs and ESB for AVS/SEM metals; the extent of acute toxicity in surficial sediments, and the correlation between values and sediment toxicity. Data from multiple sampling locations and multiple depths were collected and deemed usable; therefore, conclusions could be made regarding vertical and horizontal extents of contamination could be. While the extent of contamination is not fully defined for all chemicals, the data do provide useful information on the nature and extent of contamination within the confluence areas.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

2.2 LABORATORY ANALYSIS

A maximum of eight sediment samples were collected at each sampling station for laboratory analysis. Sediment cores were driven to the depth of refusal, or the entire length of the core, whichever came first. The number of samples collected with depth was determined based on the amount of sediment retrieved within a given core. Samples were grouped into the following zones to aid in the evaluation of the extent of contamination:

- 0 to 6 inches below sediment surface (bss); collected to characterize contaminants in biologically active zone and to evaluate sediment toxicity
- 0 to 2 ft bss; 2 to 4 ft bss; 4 to 6 ft bss; 6 to 8 ft bss; 8 to 10 ft bss; 10 to 12 ft bss; and 12 to 14 ft bss; collected to determine vertical extent and spatial distribution of contaminants

The sediment samples were analyzed for the following parameters by the laboratories indicated in the following table:

TABLE 2-3
SUMMARY OF SEDIMENT AND PORE WATER SAMPLES AND ANALYSES

Sample Type	No. From Duck Creek [1]	No. from Otter Creek [1]	Parameter	Laboratory
Surface sediment (0 to 6 inches)	11	20	34 PAHs	CLP
			TOC	CAS
			GRO/DRO/RRO	CAS
			SVOCs	CLP
			PCBs	CLP
			Metals	CLP
			Grain Size	TA
			AVS/SEM	CAS
			Toxicity [2]	ERDC
Pore water (collected as sediment)	11	20	34 PAHs	EERC
			Metals	CAS
			Hardness	CAS
			DOC	CAS
			Ammonia	CAS
			pH	CAS
Subsurface sediment	40	32	SVOCs	CLP
			PCBs	CLP
			Metals	CLP
			GRO/DRO/RRO	CAS
			TOC	CAS

Notes:
1 Does not include duplicate or split samples
2 Only the locations indicated in Subsection 2.1.2 were tested for toxicity
AVS/SEM = Acid volatile sulfides/simultaneously extracted metals

3. ANALYTICAL RESULTS

Sediment chemistry and toxicity test results for the sediment samples collected from the confluences of Duck and Otter Creeks are summarized in this section. This discussion includes the data evaluation methodology, sediment analytical results, and sediment toxicity test results.

3.1 DATA EVALUATION METHODOLOGY

Several sediment quality metrics including PEC-Q calculations, AVS/SEM evaluation, and ESB determinations; established benchmarks (i.e PECs); and multiple lines of evidence are used to determine contaminants of concern in each confluence. Surface and subsurface samples are evaluated independently to determine the risk associated with the most biologically active zone (i.e. surface sediment) and risk associated with contamination at depth (i.e subsurface sediment). The spatial distribution of the current data sets (November 2010 and May 2011) is also evaluated, and delineation of the horizontal and vertical extent of contamination is made, where possible.

3.1.1 PEC Comparison, Alternative Benchmarks, and PEC-Q Calculation

Consensus-based sediment quality guidelines (SQG) (MacDonald and others 2000) have been developed that represent the geometric mean of published SQGs from a variety of sources. These SQGs are called PECs and threshold effects concentrations (TEC). PECs are intended to identify contaminant concentrations above which harmful effects on sediment-dwelling organisms are expected. TECs are intended to identify contaminant concentrations below which

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

harmful effects on sediment-dwelling organisms are not expected. Individual analytes were compared to their respective PEC to determine contaminants of potential concern.

For chemicals lacking PECs, alternative sediment benchmarks were obtained from various other sources, including:

- EPA (1996) Assessment and Remediation of Contaminated Sediments (ARCS) program PEC and no effects concentration (NEC) benchmarks. ARCS calculated representative NECs, TECs, and PECs for *Hyalella azteca* (*H. azteca*) and *Chironomus riparius* in primarily freshwater sediments. Concentrations above the TEC may result in adverse effects to these organisms; concentrations below the TEC are unlikely to result in adverse effects. A concentration greater than the PEC is likely to result in adverse effects to these organisms.
- EPA Region 3 Biological Technical Assistance Group (BTAG), freshwater sediment screening benchmarks. The Region III BTAG developed freshwater sediment screening benchmarks to evaluate sampling data at Superfund sites. These values facilitate consistency in screening level ecological risk assessments throughout Region III. These values are available at http://www.epa.gov/reg3hwmd/risk/eco/index.htm.
- Ontario (Persaud et al., 1993) low effect level (LEL). Environment Ontario developed a LEL and severe effect level (SEL) for various chemical substances in sediment. The LEL corresponds to concentrations above which adverse biological effects are frequently found. The SEL corresponds to concentrations above which adverse biological effects are found.
- EPA Region 5 (2003) ESL for sediment. The EPA Region 5 developed media-specific (soil, water, sediment, and air) for RCRA Appendix IX hazardous constituents. The ESLs are initial screening levels with which the site contaminant concentrations can be compared. The ESLs help to focus the investigation on those areas and chemicals that are most likely to pose an unacceptable risk to the environment. The ESLs (formerly EDQL) are available at http://www.epa.gov/reg5rcra/ca/ESL.pdf
- EPA Region 4 (1995) ecological screening values for sediment. The values are the higher of the EPA Contract Laboratory Program Practical Quantitation Limit and the Effects Value, which is the lower of the ER-L and the TEL. These values are possible effects benchmarks.
- Florida (MacDonald, 1994) probable effects levels (PEL). The State of Florida developed sediment quality assessment guidelines (SQAG) for 34 priority substances, including a threshold effect levels (TEL) and PELs. These SQAGs defined three ranges of contaminant concentrations, including a minimal effects range, a possible effects range, and a probable effects range.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

- Canadian (Environment Canada, 2002) Interim Sediment Quality Guidelines (ISQG). The Water Quality Guidelines Task Group of the Canadian Council of Ministers of the Environment (CCME) developed chemical concentrations recommended to support and maintain aquatic life associated with bed sediments. The ISQG corresponds to threshold level effects below which adverse biological effects are not expected. These values are available at Environment Canada's Canadian Environmental Quality Guidelines web page at http://www.ec.gc.ca/ceqg-rcqe/English/Ceqg/Sediment/default.cfm as well as http://www.ccme.ca/assets/pdf/e1_06.pdf. Updated 2002.

- The Massachusetts Department of Environmental Protection (MDEP) has developed sediment benchmarks for petroleum hydrocarbon fractions, with values of 1,591 mg/kg_{oc} for C5 through C8 aliphatic hydrocarbons, 3,167 mg/kg_{oc} for C9 through C18 aliphatic hydrocarbons and 9,883 mg/kg_{oc} for C19 through C36 aliphatic hydrocarbons (MDEP 2007). The GRO analysis measures less than C10 hydrocarbon assemblages, DRO analysis measures C10 through C24 hydrocarbon assemblages and the RRO analysis measures less than C24 hydrocarbon assemblages. Refined petroleum products are complex variable mixtures of hundreds or thousands of organic chemicals. While estimation of ecological risk of petroleum products in sediments based on three fractions with similar chemical and toxicological properties improves the ability to more accurately estimate the potential for ecological risk of the weathered petroleum product in sediments, exceedance of a benchmark does not indicate risk. Concentrations below these benchmarks indicate that the fraction does not contribute significantly to the chemical toxicity of oil-contaminated sediments.

To predict the toxicity for mixtures of various contaminants in sediments, PEC-Q values can be determined. PEC-Q values for mixtures of chemicals (metals, PAHs, and PCBs) were determined using methods adopted from Ingersoll and others (2000 and 2001). Based on existing databases, the reliability for predicting toxicity is greatest for organic compound groups of total PAHs and total PCBs and for the metals cadmium, copper, lead, nickel, silver and zinc. Inclusion of other compounds or metals that have PEC values when insufficient data are available to evaluate predictive reliability (such as for mercury, dieldrin, DDT, endrin, and lindane) into the overall PEC-Q calculation may result in an overall PEC-Q value with lower predictive ability (Wisconsin Department of Natural Resources [WDNR] 2003).

In the case of metals, a PEC-Q_{metals} value was calculated by summing the PEC-Q value for each individual metal for which a reliable PEC is available and dividing by the number of metals included in the calculation. Mercury was not included in the PEC-Q_{metals} calculations because its

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

PEC is not considered reliable. For total PAHs, the concentration in sediment first was normalized to 1 percent (%) organic carbon to agree with the PEC. Total PAH concentrations were calculated using three methods and all are presented in the associated PEC-Q_{PAHs} tables:

- Total 16 Priority PAHs: the sum of detected concentrations of priority pollutant PAHs rounded to two significant figures from the 34 PAH analysis.
- Total Parent PAHs: the sum of detected concentrations of priority pollutant PAHs multiplied by a correction factor of 1.7 from the SVOC analysis.
- Total PAHs: the sum of detected expanded list (34) PAHs rounded to two significant figures.

A PEC-Q_{PAHs} and a PEC-Q_{PCBs} value was calculated by dividing the total PAH concentration and the total PCB concentration by the PEC for total PAHs and total PCBs, respectively.

The mean PEC-Q then was calculated for the three main classes of chemicals, as the mean of the average PEC-Q for metals, the PEC-Q for PAHs, and the PEC-Q for PCBs. Ingersoll and others (2001) observed an overall increase in the incidence of toxicity with an increase in the mean quotients in toxicity tests and a consistent increase in toxicity at a mean quotient of greater than 0.5. Similarly, McDonald et al. (1999a) report an incidence of toxicity of >85% at a mean PEC-Q above 0.5 for a variety of freshwater sediment tests. However, in the Ingersoll study, the overall incidence of toxicity was greater in long-term tests (28 days) using the amphipod *H. azteca* when compared to short-term tests. In studies by MacDonald and others 2000, the incidence of toxicity percentages correlated with calculated mean PEC-Q of 0.5, 1.0, and 5.0 are 40, 64, and 100%, respectively, in their datasets. In 10- to 14-day sediment tests evaluated by U.S. EPA (2000), the incidence of toxicity to amphipods was greater than 50% when mean PEC-Qs > 4.0 in sediment samples.

3.1.2 AVS/SEM Evaluation

Measurement of AVS and SEM concentrations associated with AVS extraction can provide insight into the bioavailability of metals in anaerobic (anoxic) sediments (U.S. EPA 2001). A model for predicting toxicity from divalent trace metals is based on the binding of these metals to

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

AVS. When the sum of the moles of the SEM (including silver, cadmium, copper, nickel, lead, and zinc) is exceeded by the molar concentration of AVS, the metals are considered insoluble and largely unavailable to biota. However, if the AVS is less than the SEM, metals may or may not be toxic due to other controlling factors (such as TOC content) (U.S. EPA 2001) as discussed below for the ESB determination.

3.1.3 ESB Determination

ESBs are mechanistic sediment quality metrics that use the theories of equilibrium partitioning (EqP) to derive sediment-specific predictions of available contaminant exposures. U.S. EPA has derived ESBs for PAHs and a suite of divalent metals as discussed below.

PAH ESBs

There are potentially more than 1,000 PAH configurations. Initially, U.S. EPA identified 13 PAHs as parameters of concern. The National Oceanic and Atmospheric Administration began to quantify 10 additional PAHs in sediments, bringing the total number of PAHs measured to 23. More recently, the U.S. EPA Environmental Monitoring and Assessment Program has increased the number of PAHs measured from 23 to 34 by quantifying the C1 through C4 alkylated series for some patent PAHs, where the "C" number indicates an alkyl group substitution (U.S. EPA 2003). Because alkylated PAHs are often more abundant in fresh petroleum products than their un-substituted parent compounds and because the proportion of alkylated PAHs to parent compound PAHs increases as oil ages, it is important to analyze for alkylated PAHs when biological effects are a concern (National Park Service 1997). U.S. EPA currently recommends that a minimum of 34 configurations (18 parents and 16 alkylated PAHs) be used to assess "total PAH" concentrations in sediment (U.S. EPA 2003).

ESBTU values have been derived for the 34 PAHs to predict aqueous concentrations of each PAH in sediment with a known TOC content. This concentration is then normalized by its water-only FCV, which was derived using National Water Quality Criteria (WQC) guidelines. The FCV is used as the toxicity endpoint for this ESB, and the FCV is intended to be the concentration of a chemical in water that is protective of the presence of aquatic life. The individual

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

ESBTU of all 34 PAHs (including specific non-alkylated and generic alkylated forms) are summed to derive an ESBTU based on FCV ($\sum ESBTU_{FCV}$) for a sampling location. Benthic organisms should be acceptably protected from the narcotic effects of PAH mixtures in freshwater and saltwater sediments if the $\sum ESBTU_{FCV}$ is less than or equal to 1.0 (U.S. EPA 2003). If the $\sum ESBTU_{FCV}$ is greater than 1.0, sensitive benthic organisms may be adversely affected.

Metals ESBs

ESB Metals values are derived based on two lines of evidence to evaluate metal toxicity: the concentrations of sediment-associated metals in excess of the AVS concentration and dissolved metals concentrations in interstitial water (U.S. EPA 2005). Both are considered for this evaluation as AVS/SEM analyses were conducted for surface sediments and metals concentrations were measured in pore water.

AVS ESB values can provide a more accurate prediction of toxicity because the presence of organic carbon (oc) is considered along with AVS using the following equation:

$$\left(\sum SEM - AVS\right) / \; foc \Big/ \left(\sum \frac{SEM - AVS}{foc}\right)$$

where

SEM	=	Simultaneously extracted divalent metal (micromoles [µmole])
AVS	=	Acid volatile sulfides (micromole per gram [µmole/g])
foc	=	Fraction oc (grams [g])

For the multiple metals (cadmium, copper, lead, nickel, silver and zinc), the assumptions summarized below are useful to derive a benchmark (U.S. EPA 2005).

- Any sediment with an AVS > 0.0 will not cause adverse biological effects due to chromium or silver.
- SEM-AVS/foc < 130 µmole/grams organic carbon (goc): metals (cadmium, copper, lead, nickel, or zinc) should pose a low risk for adverse biological effects.
- SEM-AVS/foc > 130 µmole/goc < 3,000 µmole/goc: metals (cadmium, copper, lead, nickel, or zinc) may have adverse biological effects.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

- SEM-AVS/foc > 3,000 µmole/goc: metals (cadmium, copper, lead, nickel, or zinc) are expected to cause adverse biological effects.

Pore Water Concentrations

Similar to bulk sediment benchmark comparisons, pore water chemistry data are used for comparisons with water quality benchmarks to assess the potential for toxicity of a sample. The advantage of pore water benchmarks over sediment benchmarks is that they tend to reflect location-specific sediment characteristics (e.g., TOC and AVS concentrations) that may increase/decrease the proportion of contaminants available for uptake from sediment pore water.

Pore water data were compared to State of Ohio WQC and Lake Erie basin criteria. For chemicals lacking Ohio-specific values, alternative sources of ambient WQC values included State of Michigan WQC, U.S. EPA national WQC, and National Ocean and Atmospheric Administration Screening Quick Reference Tables (SQUIRTS) for surface water benchmarks. Exceedance of these values indicates potential adverse biological effects.

In the absence of a water-quality benchmark for PAHs, pore water benchmarks derived by U.S. EPA (2003) were used. U.S. EPA (2003) derived individual PAH-specific FCVs using the slope of the water partitioning (K_{OW})-toxicity relationship for all narcotic chemical classes, the EqP approach of DiToro et al. (2003a, as cited in U.S. EPA 2003), and the U.S. EPA National WQC (Stephan et al., 1985, as cited in U.S. EPA, 2003). Pore water concentrations less than surface water benchmarks should not cause direct toxicity to benthic organisms. A total interstitial water toxic unit ($\Sigma IWTU_{FCV}$) is calculated for each sample location by dividing the dissolved interstitial water concentration by the FCV and summing the individual toxic units. Pore water containing <1.0 $\Sigma IWTU_{FCV}$ of the mixture of the PAHs are acceptable for the protection of benthic organisms, and if the $\Sigma IWTU_{FCV}$ is greater than 1.0, sensitive benthic organisms may be unacceptably affected (U.S. EPA, 2003).

3.2 SEDIMENT ANALYTICAL RESULTS

Data tables are provided for the analytical results for sediment samples collected from the confluences of Duck and Otter Creeks. **Appendix B** provides all analytical data. **Table 3-1**

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

presents the overall mean PEC-Q values and ESBs for each sampling location in the confluences of Duck and Otter Creeks. Sediment analytical results and evaluations for each creek are included below.

3.2.1 Duck Creek

Tables 3-2 through **3-7** summarize the analytical results for inorganic analytes, PCBs, petroleum hydrocarbons, PAHs, SVOCs, and grain size collected from the Duck Creek confluence, respectively. **Tables 3-8** through **3-11** summarize the analytical results for PEC-Q_{metals} and PEC-Q_{PAHs}; AVS/SEM data, and the 34 PAHs, respectively. **Table 3-12A and Table 3-12B** present the pore water data for the Duck Creek confluence. **Figures 3-1** through **3-9** graphically depict inorganic analytes above screening benchmarks, PCB PEC and PEC-Q results, petroleum hydrocarbons above screening benchmarks, PAH results above PECs, SVOC results above screening benchmarks, PEC-Q_{metals} results, PEC-Q_{PAH} results, AVS/SEM results, and PAH $\sum ESBTU_{FCV}$ results, respectively. The text below provides summary descriptions of the results.

Individual Benchmark/PEC Exceedances

Metals

Table 3-2 summarizes Duck Creek confluence metals results and **Figures 3-1** show the metals PEC exceedances. Individual metal PEC exceedances within Duck Creek were identified for arsenic, cadmium, chromium, mercury, lead and nickel, with concentrations exceeding PECs in only a few samples. Alternative sediment benchmarks for iron, selenium, and silver were also exceeded.

PCBs

Table 3-3 summarizes Duck Creek confluence PCB results and **Figure 3-2** shows the PCB PEC exceedances. Total PCB PEC exceedances in the Duck Creek confluence were identified at depth (predominantly deeper than 24 inches bss) in multiple intervals at six of 11 sample locations (DC-13, DC-16, DC-17, DC-19, DC-21, and DC-25).

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Petroleum Hydrocarbons

Table 3-4 summarizes Duck Creek confluence total petroleum hydrocarbon results and **Figure 3-3** shows the total petroleum hydrocarbon results above screening benchmarks. No PEC or TEC criteria are available for DROs, GROs, and OROs. However, all of the samples from the Duck Creek confluence contained detected concentrations of DROs, GROs, and OROs. The DRO values ranged from 210 to 3,800 mg/kg. The GRO values ranged from 2.8 to 62 mg/kg, with highest concentration detected at depth in DC-14-05. The RRO values ranged from 650 to 5,900 mg/kg. The highest DRO and RRO concentrations were detected in the deepest interval at DC-19-04. At sample core locations DC-14, DC-16, DC-17, DC-19, and DC-21, DRO and ORO concentrations increased with depth from the upper to the bottom sample intervals.

The GRO concentration at one location (DC-14-05) exceeds the highest of the MDEP benchmarks. Note that exceedance of a benchmark does not indicate risk. Rather, concentrations below these benchmarks indicate that the fraction does not contribute significantly to the chemical toxicity of oil-contaminated sediments.

PAHs

Tables 3-5A and 3-5B summarize PAH results for November 2010 and May 2011, respectively, in the Duck Creek confluence, and **Figure 3-4** shows the PAH PEC exceedances. Individual PAH PEC exceedances within the Duck Creek confluence were identified mostly in deeper sample intervals, though individual PEC exceedances were identified in shallow samples at DC-13, DC-16, DC-17, DC-20 and DC-24. The vertical extent of individual PAHs has not been defined at all locations within Duck Creek, such as DC-16 and DC-17.

SVOCs

Tables 3-6A and 3-6B summarize SVOC results for November 2010 and May 2011, respectively, in the Duck Creek confluence in comparison to alternative sediment benchmarks. **Figure 3-5** shows SVOC concentrations above the benchmarks. SVOCs detected in sediments included 1,1-biphenyl, 4-methylphenol, acetophenone, benzaldehyde, bis(2-ethylhexyl)phthalate

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

(BEHP), carbazole, dibenzofuran, di-n-butylphthalate, n-nitrosodiphenylamine, nitrobenzene, and phenol. Primarily BEHP, a common laboratory contaminant, exceeded alternative sediment benchmarks. However, in aqueous exposures, BEHP is not toxic to aquatic organisms at concentrations up to the solubility limit (Call et al. 2001; Rhodes et al. 1995). Sediment spiked with 3,000,000 µg/kg BEHP had no effect on either survival or growth of midges and amphipods (Call et al. 2001). The maximum detected BEHP concentration (3,300 ug/kg at DC-25-2) does not exceed this concentration. Thus, measured BEHP concentrations were not high enough to be considered a contaminant of concern.

Mean PEC-Q Threshold Exceedances

Table 3-1 summarizes the individual and mean PEC-Q values calculated for each sample within the Duck Creek confluence and **Figure 3-2, Figure 3-6, and Figure 3-7** show the Duck Creek confluence mean PEC-Q exceedances for PCBs, metals, and PAHs, respectively. Mean PAH, PCB, and metals PEC-Q values provide an understanding of the greatest contributor to each calculated mean PEC-Q values. Calculation of mean PEC-Q values is provided in **Tables 3-3 for PCBs, Table 3-8** for metals, and **Tables 3-9A and 3-9B** for PAHs.

The mean PEC-Q threshold value of 1.0 was exceeded in the deeper intervals at DC-16, DC-17, DC-19, and DC-21, with the highest mean PEC-Q value of 3.56 at DC-17-05. These exceedances of the mean PEC-Q threshold value of 1.0 indicate that PCBs are the primary contributor to the potential risk for biological effects, with some contribution to the mean PEC-Q from metals (with $PEC\text{-}Q_{metals} > 0.5$) at locations DC-16 and DC-17.

Physical Properties

Table 3-7 summarizes the Duck Creek confluence grain size analysis. The geotechnical results for the 11 samples collected from the Duck Creek confluence indicate that the material sampled consisted primarily of silt mixed with some very fine sand and clay.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

AVS ESB

Table 3-10 summarizes the derivation of the Duck Creek confluence AVS/SEM values. The metals ESB values ([Sum SEM – AVS]/foc) for all Duck Creek samples yielded results less than 130 µmole/goc, indicating low risk of adverse biological effects from metals. This conclusion is also supported by the AVS/SEM ratios, which are also less than 1.

PAH ESBTU

Tables 3-11A and 3-11B summarize the derivation of Duck Creek confluence ESBTUs for EPAHs. The PAH $\sum ESBTU_{FCV}$ did not exceed the threshold of 1 at any surface sample location within Duck Creek, suggesting that PAHs in surface sediment are not a primary contaminant of concern as adverse effects from PAHs are not likely.

3.2.2 Otter Creek

Tables 3-13 through 3-18, summarize the Otter Creek confluence analytical results for inorganic analytes, PCBs, petroleum hydrocarbons, PAHs, SVOCs, and grain size collected from the Duck Creek confluence, respectively. **Table 3-14, Table 3-19, and Tables 3-20A and 3-20B** present the PEC-$Q_{PCBs,}$ PEC-Q_{metals} and PEC-Q_{PAHs} results, respectively. **Table 3-21** summarizes the AVS/SEM results. **Tables 3-22A and 3-22B** present the expanded list of PAHs (EPAH) for November 2010 and May 2011 sampling results. **Table 3-23** presents the pore water data for the Otter Creek confluence. **Figures 3-10** through **3-18** graphically depict inorganic analytes above screening benchmarks, PCB PEC and PEC-Q results, petroleum hydrocarbons above screening benchmarks, PAH results above PECs, SVOC results above screening benchmarks, PEC-Q_{metals} results, PEC-Q_{PAH} results, AVS/SEM results, and PAH $\sum ESBTU_{FCV}$ results, respectively. The text below provides summary descriptions of the results.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Individual Benchmark/PEC Exceedances

Metals

Table 3-13 summarizes Otter Creek confluence metals results and **Figure 3-10** shows the metals PEC exceedances. Individual metal PEC exceedances within the Otter Creek confluence were identified for arsenic, chromium, copper, lead, mercury and nickel, with exceedances measured at sample locations OC-34, OC-41, OC-42, OC-44, and OC-45. Alternative sediment benchmarks for iron, selenium, and silver were also exceeded.

PCBs

Table 3-14 summarizes Otter Creek PCB results and **Figure 3-11** shows the PCB PEC exceedances. Total PCB PEC exceedances within the Otter Creek confluence were identified at depth at three sampling locations (OC-35, OC-45 and OC-48).

Petroleum Hydrocarbons

Table 3-15 summarizes the Otter Creek confluence petroleum hydrocarbon results and **Figure 3-12** shows the petroleum hydrocarbons over the screening benchmark. No PEC or TEC criteria are available for GROs, DROs, and RROs. However, most of the samples from the Otter Creek confluence contained detected concentrations of GROs, DROs and RROs. The GRO values ranged from 12 to 1,900 mg/kg. The highest concentration was detected in the deeper interval at OC-45-02. The DRO values ranged from 26 to 60,000 mg/kg. The highest concentration was detected in the deeper interval at OC-44-02. The RRO values ranged from 39 to 64,000 mg/kg. The highest concentration was detected in the deeper interval at OC-44-02.

Numerous locations contained GRO, DRO and RRO concentrations exceeding the highest of the MDEP benchmarks. Note that exceedance of a benchmark does not indicate risk. Rather, concentrations below these benchmarks indicate that the fraction does not contribute significantly to the chemical toxicity of oil-contaminated sediments.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

PAHs

Tables 3-16A and 3-16B summarize the Otter Creek confluence PAH results for November 2010 and May 2011, respectively; and **Figure 3-13** shows the total PAH PEC exceedances. Individual PAH PEC exceedances within Otter Creek were identified at locations OC-26 through OC-30, OC-32, OC-42, and OC-44 within the upper sample intervals (0 to 6 inches and 0 to 2 feet bss). Exceedance of individual PAH PECs was found in deeper interval samples at OC-31, OC-34, OC-44, and OC-45.

SVOCs

Table 3-17A and 3-17B summarize the Otter Creek confluence SVOC results in comparison to alternative sediment benchmarks for the November 2010 and May 2011 sampling events, respectively. **Figure 3-14** shows SVOCs detected above the benchmarks. SVOCs detected in sediments included 1,1-biphenyl, 4-methylphenol, acetophenone, benzaldehyde, BEHP, carbazole, dibenzofurna, di-n-butylphthalate, n-nitrosodiphenylamine, nitrobenzene, and phenol.

Mean PEC-Q Threshold Exceedances

Table 3-1 summarizes the mean PEC-Q values calculated for each sample within the Otter Creek confluence and **Figures 3-11, 3-15, and 3-16** show the Otter Creek confluence PEC-Q_{PCBs}, PEC-Q_{metals}, and PEC-Q_{PAHs} values, respectively. Mean PAH, PCB, and metals PEC-Q values provide an understanding of the greatest contributor to each calculated mean PEC-Q values. Calculation of mean PEC-Q values is provided in **Tables 3-14** for PCBs, **Table 3-19** for metals, and **Tables 3-20A and 3-20B** for PAHs.

The mean PEC-Q threshold value of 1.0 was exceeded at 1 location in Otter Creek (OC-44-02), with the PEC-Q for metals, PCBs, and PAHs exceeding a threshold of 0.5. The mean PEC-Q threshold value of 0.5 was exceeded at nine surface and subsurface locations (OC-26, OC-29, OC-31-02, OC-34-02, OC-35-02, OC-42-01, OC-44-01, OC-45-02, and OC-48-04). The PAH PEC-Q exceeded 1.0 at locations OC-26, OC-32, OC-42 (DP), OC-44-02 and OC-45-02 **(Table 3-1);** with exceedances of 0.5 in eleven other samples**.** PAHs appear to be a primary contributor

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

to the potential risk for biological effects, with a contribution from metals at OC-44-02 and a contribution from PCBs at OC-35-02 to the respective mean PEC-Q.

Physical Properties

Table 3-18 summarizes the Otter Creek confluence grain size results. The geotechnical results for the samples collected from the Otter Creek confluence indicates the material sampled consisted primarily of silt and clay material mixed with some very fine sand.

AVS ESB

Table 3-21 summarizes the derivation of the Otter Creek confluence AVS/SEM values. **Figure 3-17** shows the AVS/SEM results for the Otter Creek confluence. In contrast to PAH ESBTUs, the Otter Creek metals ESB values ([Sum SEM – AVS]/foc) for all samples yielded results less than 130 μmole/goc, indicating low risk of adverse biological effects from metals. This result is also supported by the AVS/SEM ratios for these samples, which are less than 1.

PAH ESBTU

Tables 3-22A and 3-22B summarize the derivation of Otter Creek confluence ESBTUs for EPAHs. **Figure 3-18** shows the PAH ∑ESBTUFCV results. The PAH $\sum ESBTU_{FCV}$ exceeded the threshold of 1 at OC-26 through OC-30, OC-32, OC-34, OC-42, an OC-44, which indicates that benthic organisms may be adversely impacted by PAHs in shallow sediment.

3.3 PORE WATER ANALYTICAL RESULTS

Tables 3-12A/B and 3-23A/B provide the analytical results for sediment pore water samples collected from the Duck and Otter Creek confluences, respectively. **Figures 3-19 and 3-20** show pore water concentrations above applied benchmarks. Pore water evaluations for each creek are provided below.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

3.3.1 Duck Creek

Tables 3-12A and 3-12B summarize the pore water results for surface sediment samples collected from the Duck Creek confluence. In relation to WQC, ammonia concentrations were elevated in 10 of 11 samples. Measurable concentrations of ammonia are common in the pore water of many types of sediment and have been found to be a common cause of toxicity in pore water (ASTM, 2005). Four-day LC50 values for *Lumbriculusvariegatus* ranged from 390 to 6.6 mg/L total ammonia as pH was increased from 6.3 to 8.6. Over a similar same pH range, 4-day lethal concentration 50 (LC50) values for *C. dilutus* ranged from 370 to 82 mg/L total ammonia. In soft reconstituted water, toxicity of ammonia to *H. azteca* was not pH dependent, with 4-day LC50 values of about 20 mg/L (ASTM, 2005). Ammonia in Duck Creek ranged from 1.81 mg/L at DC-20 (pH = 7.76) to 17 mg/L at DC-13 (pH = 7.31).

Barium slightly exceeded chronic water quality criteria in one sample (DC-21) and manganese exceeded chronic water quality criteria in several samples. Barium and manganese did not exceed acute criteria. The State of Michigan has developed hardness-based FCVs (analogous to Ohio's Outside Mixing Zone Average) for barium and manganese using the Great Lakes Initiative methodology. The hardness listed for sample DC-21 was quite high (1,050 mg/L as CaCO3), and barium toxicity is known to decrease with increasing hardness. At this hardness, the calculated FCV for barium is 5,300 µg/L. A hardness of 300 mg/L as CaCO3 (typical of pore water hardness in this study) yields a calculated manganese FCV of 5,100 µg/L. The maximum manganese pore water concentration was 1,990 µg/L at DC-14. Thus, the measured barium and manganese concentrations in this study do not exceed these levels and are unlikely to cause adverse biological effects.

C4-Naphthalene was elevated in one sample (DC-25). The $\Sigma IWTU_{FCV}$ at this location also exceeded the threshold of 1 (**Table 3-12A**).

3.3.2 Otter Creek

Tables 3-23A and 3-23B summarize the pore water results for surface sediment samples collected from the Otter Creek confluence. In relation to WQC, ammonia concentrations were

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

elevated in 11 of 19 samples. Measurable concentrations of ammonia are common in the pore water of many types of sediment and have been found to be a common cause of toxicity in pore water (ASTM, 2005). Four-day LC50 values for *Lumbriculusvariegatus* ranged from 390 to 6.6 mg/L total ammonia as pH was increased from 6.3 to 8.6. Over a similar same pH range, 4-day LC50 values For *C. dilutus* ranged from 370 to 82 mg/L total ammonia. In soft reconstituted water, toxicity of ammonia to *H. azteca* was not pH dependent, with 4-day LC50 values of about 20 mg/L (ASTM, 2005). Ammonia in Otter Creek ranged from 0.252 mg/L at OC-41 (pH = 7.75) to 18.5 mg/L at OC-44 (pH = 7.31).

Manganese exceeded acute criteria in two samples (OC-47 and OC-48), and manganese exceeded chronic WQC in all samples. The State of Michigan has developed hardness-based FCVs (analogous to Ohio's Outside Mixing Zone Average) for manganese using the Great Lakes Initiative methodology. A hardness of 300 mg/L as CaCO3 (typical of pore water hardness in this study) yields a FCV of 5,100 µg/L. The maximum manganese pore water concentration was 4,210 µg/L at OC-47. Thus, the measured manganese concentrations in this study do not exceed these levels and are unlikely to cause adverse biological effects.

Numerous PAHs were elevated in 9 of 18 samples (OC-26 through OC-30, OC-32, OC42, OC44, and OC-45). The $\Sigma IWTU_{FCV}$ at 10 locations (OC-26 through OC-30, OC-32, OC-35, OC42, OC44, and OC-45) exceeded the threshold of 1 (**Table 3-23A**).

3.4 SEDIMENT TOXICITY TEST RESULTS

The Army Engineer Research and Development Center (ERDC) conducted acute toxicity testing on sediments from the Duck and Otter Creek confluences at the request of GLNPO as part of its GLLA initiative. Twenty-two whole sediment samples were evaluated using the midge *C. dilutus*. Toxicity tests were conducted in basic accordance with guidance provided in "Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Freshwater Invertebrates" (U.S. EPA 2000). Testing conducted for samples collected during the November 2010 sampling event was initiated on November 19, 2010 and completed on December 23, 2010. The evaluation was conducted blind, in that the ERDC was unaware of the

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

amounts or types of contaminants in the sediment samples and where they were collected (ERDC, 2011). Testing conducted for samples collected during the May 2011 sampling event was initiated on September 6, 2011 and was completed on September 16, 2011.

Water quality parameters for all bioassays were within the acceptability ranges specified by U.S. EPA (2000) testing guidance. Survival in the negative control exceeded 78% and 88% for the November 2010 and May 2011 samples, respectively, in all tests and met the 70% minimum survival requirement indicated in U.S. EPA (2000) testing guidance (ERDC, 2011).

Table 3-24 summarizes the survival and growth results for *C. dilutus* after exposure to confluence sediment. Upon observation of results presented by ERDC, percent survival, ash-free biomass, and ash-free growth of *C. dilutus* at stations OC-28, OC-29 and OC-30 (November 2010 samples) and DC-25, OC-35, OC-38, OC-41, OC-44, and OC-45 (May 2011 samples) had noticeable variation among test replicates, mean values appeared low compared to test controls, and/or inconsistent results across all endpoints were reported.

The outcomes of statistically different determination were updated by WESTON after re-evaluation of the statistics using ToxCalc software. Both ERDC (SigmaStat) and WESTON (Toxcalc) used comparison procedures for data sets that were both normally and not normally distributed. Both methods are acceptable statistical approaches, however Kruskal–Wallis One-Way ANOVAs on ranks (followed by Dunnett's or Dunn's mean comparisons) performed by ERDC were not as sensitive to differences compared to Wilcoxon Rank Sum Tests and Steel's Many-One Rank Tests performed by WESTON.

Statistically different survival and growth results for several samples changed compared to results initially reported by ERDC. **Table 3-24** summarizes the original ERDC results and WESTON-updated statistically different outcomes. **Appendix C** presents the sediment toxicity test reports in full and the WESTON statistical results.

Significant reduction in survival was detected in OC-26, OC-27, OC-42, and OC-44 sediment samples. Significant reductions in ash-free biomass per initial organism were detected for sediment samples OC-26, OC-28, OC-29, OC-30, DC-25, OC-35, OC-38, OC-41, OC-42, OC-

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

44, OC-45, and OC-46. A significant reduction in ash-free dry weight per surviving organism was observed for sediment samples OC-26, OC-28, OC-29, OC-30, OC-31, DC-25, OC-35, OC-38, OC-42, OC-44, OC-45, and OC-46. No significant effects on survival or biomass were detected for the remaining sediment samples evaluated.

4. WEIGHT-OF-EVIDENCE EVALUATION

A weight-of-evidence evaluation was conducted to further determine the contaminants of concern in the confluence of Otter Creek. The evaluation focuses on the sediments of the Otter Creek confluence as toxicity was observed in only one of eight Duck Creek confluence sediments; and wide-spread concentrations above individual PECs and PEC-Q were limited to PCBs that were in deeper subsurface sediment.

The weight-of-evidence evaluation examined patterns and correlations between sediment and pore water contaminants and groups of contaminants in relation to observed toxicity. **Table 4-1** below summarizes the PEC quotients, ESTBU, and SEM/AVS ratios with comparison to survival and growth results.

TABLE 4-1
SUMMARY OF PEC QUOTIENTS, ESBTU, AND SEM/AVS RATIOS WITH TOXICITY RESULTS

Notes:
PEC-Q ratios exceeding 0.5 (expected toxicity outcome = 40% for 28+ day tests) but less than 1 are highlighted in yellow
PEC-Q ratios exceeding 1 (expected toxicity outcome = 64% for 28+ day tests) but less than 5 are highlighted in orange.
PEC-Q ratios exceeding 5 (expected toxicity outcome = 100% for 28+ day tests) are highlighted in red.
PAH ESTBU values less than or equal to 1 are not predicted to cause toxicity. ESTBU values exceeding 1 are highlighted in red.
Sum (SEM - AVS)/foc µmole/goc ratios less than 130 are not predicted to cause toxicity.
NA - Not applicable
Observed toxic effects as represented by significantly different survival, growth (ash free dry weight), and/or replicate ash-free bioamass/initial organism

To summarize the results in **Table 4-1**, sediment sampling locations OC-26, OC-27, OC-30, OC-42, and OC-44 showed toxicity for both survival and growth. All samples resulted in PAH $\sum ESBTU_{FCV}$ values of greater than 5, indicating a pattern of PAH $\sum ESBTU_{FCV}$ concentrations over 5.0 to predict toxicity for the Otter Creek confluence sediments.

Table 4-2 below summarizes the pore water concentrations exceeding applied benchmarks with comparison to observed toxicity.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Mn – Manganese

To summarize the results in **Table 4-2**, sediment sampling locations OC-26, OC-27, OC-30, OC-42, and OC-44 showed toxic effects for both survival and growth, and all samples resulted in pore water concentrations above PAH and metals screening values. However, the hardness values for the Otter Creek confluence resulted in a calculated manganese FCV (5,100 ug/L) that is higher than the benchmarks applied for manganese. None of the manganese concentrations in pore water exceed the hardness-specific FCV, therefore manganese is precluded as a contaminant of concern in pore water.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Ammonia exceeded chronic water benchmarks in almost all samples tested for toxicity, but a pattern of ammonia with observed toxic effects does not appear to be present as several samples contained elevated ammonia that did not result in any toxic effects. Further, the ammonia concentrations detected in Otter Creek confluence pore water do not exceed established LC50 values for *C. dilutus* or *H. azteca*.

A Spearman-Rank correlation was conducted for the Otter Creek confluence using all available chemical and toxicity data. This method is based on ranks instead of the magnitude of individual sample results (in contrast to a Pearson correlation), and is used in the case where data do not meet assumptions of normality. A spearman correlation coefficient is generated as a result of the test, and the closer the result is to 1 or -1, the higher the correlation. Significance is determined based on a critical value, which is based on the sample size. Significant correlation results are highlighted in **Table 4-3** and are greater than the absolute value of the critical value.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Shading indicates negative correlation over critical value.

Metals

The results of the correlation show that copper and lead in sediment were negatively correlated to both *C. dilutus* survival and growth. AVS cadmium showed a strong negative correlation for both survival and growth with *C. dilutus.* Dissolved lead in pore water also showed a strong negative correlation to survival and growth in *C. dilutus*. Correlation plots for metals and AVS metals in sediment are shown on **Figure 4-1**. Correlation plots for metals in pore water are shown on **Figure 4-2**. The correlation plots indicate a trend between metals and reduction in proportional survival of *C. dilutus* at location OC-26, OC-27, OC-42, and OC-44.

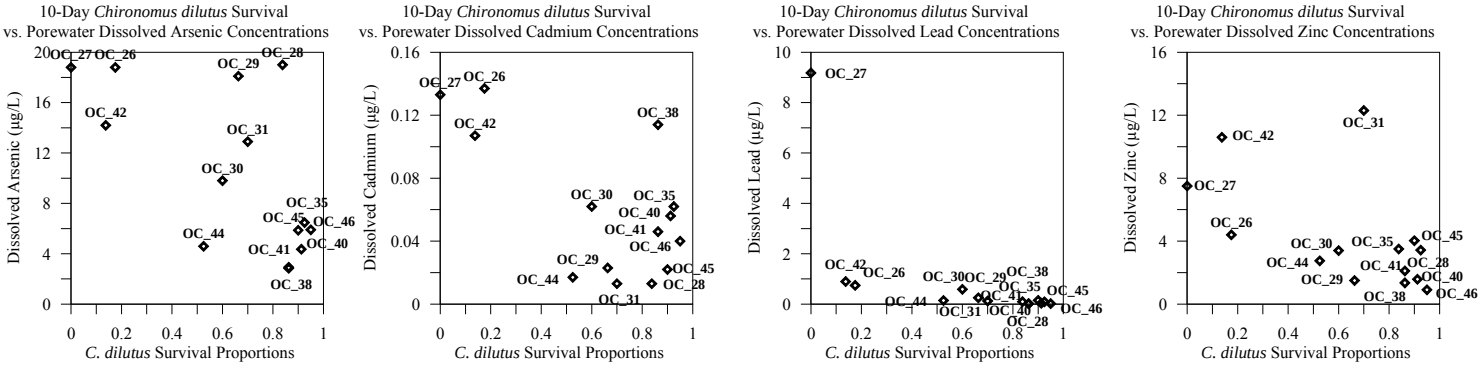
FIGURE 4-2
METALS IN PORE WATER CORRELATION PLOTS FOR OTTER CREEK CONFLUENCE



PAHs

There are numerous PAHs negatively correlated to survival and growth, both in the sediment and pore water. To illustrate the correlations, survival results were graphed with sediment PAH $\sum$ESTBU$_{FCV}$, total PAH PEC-Q, and pore water total 34 PAH results. Correlation plots for PAHs in sediment and pore water are shown on **Figure 4-3**. Using a survival threshold proportion of 0.7, the correlation plots indicate a trend between PAHs and the reduction in proportional survival of *C. dilutus* at locations OC-26, OC-27, OC-29, OC-30, OC-42, and OC-44.

5. CONCLUSIONS

This section summarizes the data collected, results, and interpretation that support the project objectives that included:

- Determine the extent of contamination in both surface and subsurface sediments
- Further evaluate sediment toxicity and identify cause(s), to the extent practicable
- Collect data to support development of a FS (evaluation of remedial and restoration options to protect human health and the environment and to advance progress toward delisting of beneficial use impairments), if one is found to be necessary

Conclusions drawn to address these specific objectives are discussed below.

5.1 EXTENT OF CONTAMINANTS OF CONCERN

Duck Creek Confluence

PCBs are identified as the primary contaminant of concern in the confluence of Duck Creek based on the wide-spread incidence of concentrations over the total PCB PEC and the PEC-Q_{PCB}. The vertical extent of PCB contamination in the Duck Creek confluence has not been defined as PEC and PEC-Q_{PCB} exeedances were present in the deepest intervals of DC-13, DC-16, DC-17, and DC-19. The horizontal extent of contamination is potentially defined to the north at DC-14; however, there were no additional samples to the north. PCB concentrations above the PEC of 676 µg/kg ranged from 860 µg/kg at DC-13-03 to 6,500 µg/kg at DC-17-05.

Although the distribution of elevated PCB concentrations is wide-spread in the Duck Creek confluence, there are no incidences of elevated PCB concentrations in the shallow sediment (0 to 6 inches). The highest concentrations occur at 24 inches bss or deeper and in many cases, concentrations increase with depth. This concentration stratification indicates PCBs are most likely not available to the benthic community. Further, toxicity was observed in only one of eight sediment samples (DC-25) that is most proximal to the mouth of Duck Creek.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

Otter Creek Confluence

PAHs are identified as the primary contaminant of concern in the confluence of Otter Creek based on the wide-spread incidence of concentrations over the total PAH PEC, the PEC-$Q_{PAH,}$ the PAH $\sum ESBTU_{FCV}$ that are present in shallow sediment, as well as the elevated PAH concentrations in pore water. The vertical extent of PAH contamination in the Otter Creek confluence appears to be predominantly limited to the upper 24 inches of sediment; although locations OC-34, OC-44, and OC-45 contained elevated PAHs in the deepest sampling interval. However, in many cases, the sediment core retrieval was limited to two to three samples due to encountered refusal; and therefore the vertical extent of contamination may be defined by the substrate causing refusal below the available sediment.

The horizontal extent of PAH contamination appears defined to the west and northwest within the confluence at locations OC-33, OC-31, and OC-41. However, the horizontal extent is not defined to the north and northeast of locations OC-28, OC-29, and OC-32 between the mouth of Otter Creek and the boundary of the shipping channel.

5.2 WEIGHT-OF-EVIDENCE

A weight-of-evidence evaluation was conducted to further determine the contaminants of concern in the confluence of Otter Creek. The evaluation focused on the sediments of the Otter Creek confluence as toxicity was observed in only one of eight Duck Creek confluence sediments; and wide-spread concentrations above individual PECs and PEC-Q were limited to PCBs that were in deeper subsurface sediment.

Toxic effects were observed for sediment sampling locations OC-26, OC-27, OC-30, OC-42, and OC-44 for both survival and growth. All these samples resulted in PAH $\sum ESBTU_{FCV}$ values of greater than 5 and $\sum IWTU$ greater than 1, indicating a pattern of PAH $\sum ESBTU_{FCV}$ and $\sum IWTU$ values to predict toxicity for the Otter Creek confluence sediments.

All samples with observed toxic effects for survival and growth resulted in pore water concentrations above PAH and metals screening values (manganese). However, the hardness

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express written permission of U.S. EPA.

values for the Otter Creek confluence resulted in a calculated manganese FCV (5,100 ug/L) that is higher than the benchmarks applied for manganese. None of the manganese concentrations in pore water exceed the hardness-specific FCV, therefore manganese is precluded as a contaminant of concern in pore water.

Ammonia exceeded chronic water benchmarks in almost all samples tested for toxicity, but a pattern of ammonia with observed toxic effects does not appear to be present as several samples contained elevated ammonia that did not result in any toxic effects. Further, the ammonia concentrations detected in Otter Creek confluence pore water do not exceed established LC50 values for *C. dilutus* or *H. azteca*.

A Spearman-Rank correlation was conducted for the Otter Creek confluence using all available chemical and toxicity data. The results of the correlation show that copper and lead in sediment were negatively correlated to both *C. dilutus* survival and growth. AVS cadmium showed a strong negative correlation for both survival and growth with *C. dilutus.* Dissolved lead in pore water also showed a strong negative correlation to survival and growth in *C. dilutus*. The correlation plots indicated a possible relationship between metals and proportional survival of *C. dilutus* at locations OC-26, OC-27, OC-42, and OC-44.

There are numerous PAHs negatively correlated to survival and growth, both in the sediment and pore water. Using a survival threshold proportion of 0.7, the correlation plots indicate a possible relationship between PAHs and proportional survival of *C. dilutus* at locations OC-26, OC-27, OC-29, OC-30, OC-42, and OC-44.

Table 3-1
Overall Mean PEC-Qs and ESBs
Duck and Otter Creeks Confluence Investigation
Toledo, Lucas County, Ohio

	PEC-Q				ESB	
Field Sample ID	**Metals**	**Total PCBs**	**Total Parent PAHs [1]**	**Overall Mean Quotient**	**(Sum SEM - AVS)/foc (µmol/goc)**	**PAH ESBTU**
Otter Creek						
OC-48-04	0.268	**1.32**	0.056	0.547	--	--

Notes:

Bold result equals or exceeds threshold of 1

-- = Value not calculated

µmol/g_{oc} = Micromole per gram organic carbon

AVS = Acid volatile sulfide

DP = Duplicate

ESB = Equilibrium partitioning sediment benchmark

ESBTU = Equilibrium partitioning sediment benchmark toxic unit

foc = Fraction organic carbon

ID = Identification

NA = Not applicable

PAH = Polycyclic aromatic hydrocarbon

PCB = Polychlorinated biphenyl

PEC-Q = Probable effect concentration quotient

Source: MacDonald, D.D., and others. 2000. "Development and Evaluation of Consensus-based Sediment Quality Guidelines for Freshwater Ecosystems." *Archives of Environmental Contamination and Toxicology.* 39: 20-31.

Incidence of adverse biological effects = 40% when mean PEC-Q > 0.5

Incidence of adverse biological effects = 64% when mean PEC-Q > 1.0

Incidence of adverse biological effects - 100% when mean PEC-Q > 5.0

1 Total Parent PAHs is the sum of detected PAHs x 1.7 (organic carbon normalized)

Notes:
Bold result exceeds sediment benchmark
-- = Criterion or value not available
ARCS PEC = U.S. EPA Assessment and Remediation of Contaminated Sediments Program probable effect concentration from U.S. EPA 1996
ARCS NEC = U.S. EPA Assessment and Remediation of Contaminated Sediments Program no effects concentration from U.S. EPA 1996
Consensus PEC = Probable effect concentration from MacDonald and others 2000
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits
J+ = Likely to have a high bias
J- = Likely to have a low bias
mg/kg = Milligram per kilogram
NA = Not available
Ontario LEL = Ontario low-effect level from Persaud and
PQL = Practical quantitation limit
R = Data rejected because of quality control deficiencies
R3 BTAG = U.S. EPA Region 3 Biological Technical Assistance Group Freshwater Sediment Screening Benchmarks from
R4 = U.S EPA Region IV ecological screening value from U.S. EPA 1995
R5 ESL = U.S. EPA Region 5 ecological screening level from U.S. EPA 2003
RL = Reporting limit
U = Not detected above RL
UJ = Not detected above RL; however, RL approximate

Notes:

Bold result exceeds PEC criterion

µg/kg = Microgram per kilogram

ID = Identification

J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits

NA = Not available

NJ = Analyte "tentatively identified"; associated numerical value represents approximate concentration

P = Flag used for pesticide and Aroclor target compounds when difference of detected concentrations between two GC columns (see Form X) exceeds 25%; lower of the two values reported on Form I and flagged "P"; "P" flag not used unless a compound is identified on both columns

PCB = Polychlorinated biphenyl

PEC = Probable effect concentration

PEC-Q = Probable effect concentration quotient = Total PCBs/PEC

RL = Reporting limit

Total PCBs = Sum of detected Aroclors

U = Not detected above RL

UJ = Not detected above RL; however, RL approximate

Bold result exceeds low benchmark
Shaded result exceeds high benchmark
DRO = Diesel-range organics
FCV = Final chronic value
foc = Fraction organic carbon
GRO = Gasoline-range organics
ID = Identification
J = Estimated value
Koc = Organic carbon water partitioning coefficient
mg/kg = Milligram per kilogram
mg/L = Milligram per liter
RRO = Residual-range organics
TOC = Total organic carbon
U = Analyte not detected

1 The area under the chromatogram (including both aromatic and aliphatic hydrocarbons) between C6 and C10 is defined as GROs. The area under the chromatogram between C10 and C24 is defined as DROs. The area under the chromatogram less than C24 is defined as RROs (MDEP 2007).

2 The fraction is not likely toxic because mean LC_{50} exceeds mean aqueous solubility; on-line source: http://www.mass.gov/dep/cleanup/laws/tphbat.pdf

Sediment Benchmark (mg/kg) = Koc x FCV x foc (0.001)

Table 3-5A
Comparison of Priority Pollutant PAH Concentrations to Sediment Benchmarks - November 2010 Duck Creek Confluence Sediment Samples
Duck and Otter Creeks Confluence Investigation
Toledo, Lucas County, Ohio

Notes:
Bold result exceeds sediment benchmark
µg/kg = Microgram per kilogram
CBSQG 2000 = Consensus-based sediment quality guideline from MacDonald and others 2000
CCME 1999 = Canadian sediment quality guideline for the protection of aquatic life from CCME 1999
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits
NA = Criterion or value not available
Ontario 1993 = Guideline for the protection and management of aquatic sediment from Peraud and others 1993
PAH = Polycyclic aromatic hydrocarbon
PEC = Probable effect concentration
RL = Reporting limit
U = Analyte not detected
WDNR 2003 = Consensus-based sediment quality guideline from WDNR 2003
1 No guideline values for benzo(e)pyrene, so value for benzo(a)pyrene used
2 No guideline values for benzo(b)fluoranthene, so value for benzo(b)fluoranthene used
3 No guideline values for perylene, so value for benzo(g,h,i)perylene used

Table 3-5B
Comparison of Priority Pollutant PAH Concentrations to Sediment Benchmarks - May 2011 Duck Creek Confluence Sediment Samples
Duck and Otter Creeks Confluence Investigation
Toledo, Lucas County, Ohio

Notes:
Bold result exceeds sediment benchmark
µg/kg = Microgram per kilogram
CBSQG 2000 = Consensus-based sediment quality guideline from MacDonald and others 2000
CCME 1999 = Canadian sediment quality guideline for the protection of aquatic life from CCME 1999
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits
LS = Low soil

NA = Criterion or value not available
Ontario 1993 = Guideline for the protection and management of aquatic sediment from Peraud and others 1993
PAH = Polycyclic aromatic hydrocarbon
PEC = Probable effect concentration
RL = Reporting lmit
SIMS = Selective ion monitoring
SVOA = Semivolatile organic analysis
U = Analyte not detected
WDNR 2003 = Consensus-based sediment quality guideline from WDNR 2003
1 No guideline values for benzo(e)pyrene, so value for benzo(a)pyrene used
2 No guideline values for benzo(b)fluoranthene, so value for benzo(b)fluoranthene used
3 No guideline values for perylene, so value for benzo(g,h,i)perylene used

Table 3-6A
Comparison of SVOC Concentrations to Sediment Benchmarks - November 2010 Duck Creek Confluence Sediment Samples
Duck and Otter Creeks Confluence Investigation
Toledo, Lucas County, Ohio

Notes:
Bold result exceeds low sediment benchmark
Shaded result exceeds high benchmark
-- = Criterion or value not available
µg/kg = Microgram per kilogram
FDEP TEL/PEL = Florida Department of Enviornmental Protection threshold effect level/probable effect level
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits
R3 BTAG = U.S. EPA Region 3 Biological Technical Assistance Group Freshwater Sediment Screening Benchmarks
R5 ESL = U.S. EPA Region 5 ecological screening level for sediment
RL = Reporting limit
SVOC = Semivolatile organic compound
U = Not detected above RL
UJ = Not detected above RL; however, RL approximate
U.S. EPA = U.S. Environmental Protection Agency

Mean PEC-Q			0.38		**0.75**		**0.76**		0.37		0.42

Notes:

Bold result exceeds PEC-Q of 0.5

ID = Identification

J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits

J+ = Likely to have a high bias

J- = Likely to have a low bias

Mean PEC-Q = Sum(PEC-Q) / No. of inorganics positively detected

mg/kg = Milligram per kilogram

R = Data rejected because of quality control deficiencies

RL = Report limit

PEC = Probable effect concentration from Ingersoll and others 2000

PEC-Q = Result / PEC

U = Not detected above RL

1 Only arsenic, cadmium, chromium, copper, lead, nickel, and zinc were used to determine the metals PEC-Q.

Notes:
Shading indicated PEC exceedance
µg/kg - Microgram per kilogram
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits
NA = Criterion or value not available
PAH = Polycyclic aromatic hydrocarbon
PEC = Probable effect concentration
PEC-Q = Probable effect concentration quotient
PPAH = Priority pollutant PAH
RL = Reporting limit
TOC = Total organic carbon
U = Not detected above RL
1 16 PPAHs include acenaphthene, acenaphthylene, anthracene, fluorene, naphthalene, phenanathrene, benzo(a)anthracene, benzo(a)pyrene, benzo(ghi)perylene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(ah)anthracene, indeno(1,2,3-cd)pyrene, fluoranthene, and pyrene.
2 For PAHs, the PEC-Q is normalized to 1% organic carbon by dividing the site concentration by the percent TOC.

This document shall not be disclosed without express written permission of U.S. EPA

Notes:
µmole/g = Micromole per gram
AVS = Acid volatile sulfide
foc = Fraction organic carbon
g/g = Gram per gram
goc = gram organic carbon
ID = Identification
J = Estimated value
RL = Reporting limit
SEM = Simultaneously extracted metals
s.u. = Standard unit
TOC = Total organic carbon
U = Not detected above RL
If SEM/AVS ratio < 1, the sediments are not toxic.
If AVS ≥ SEM (cadmium, copper, lead, nickel, silver, and zinc/2), then no biological effects from metals in sediment.
Molecular weights: sulfur, 32.06; nickel, 58.7; zinc, 65.4; cadmium, 112; lead, 207; copper, 63.5; silver, 108
Any sediment in which (SEM-AVS)/foc < 130 µmole/goc should pose low risk of adverse biological effects from cadmium copper, lead, nickel, and zinc.
Any sediment in which 130 µmole/goc < (SEM-AVS) /foc < 3,000 µmole/goc may have adverse biological effects from cadmium copper, lead, nickel, and zinc.
Any sediment in which (SEM-AVS)/foc > 3,000 µmole/goc may have adverse biological effects from cadmium copper, lead, nickel, and zinc.
Any sediment with AVS > 0.0 will not cause adverse biological effects from chromium or silver.

Table 3-11A
Derivation of Total PAH ESBs - November 2010 Duck Creek Confluence Sediment Samples
Duck and Otter Creeks Confluence Investigation
Toledo, Lucas County, Ohio

Notes:
-- = Criterion or value not available
µg/g = Microgram per gram
µg/goc = Microgram per gram organic carbon
µg/kg = Microgram per kilogram
Coc = Concentration organic carbon
Conc = Concentration
ESB = Equilibrium partitioning sediment benchmark
ESBTU = Equilibrium partitioning sediment benchmark toxic unit
FCVi = Final chronic value for individual PAH
foc = Fraction organic carbon
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits
Maxi = Maximum individual PAH
NA = Criterion or value not available
PAH = Polycyclic aromatic hydrocarbon
PAHi = Individual PAH
RL = Reporting limit
TOC = Total organic carbon
U = Coded data omitted from ESB calculations
wt = Weight
1 PAHs and corresponding Coc PAHi, FCVi, Coc PAHi, and Maxi values are from Table 3-4 in U.S. EPA 2003; example calculations provided in Table 6-3 in U.S. EPA 2003
2 Because COC exceeds COC, PAHi, Maxi , COC, PAHi, Maxi is substituted for COC to calculate ESBTU FCVi (see text).
3 Sum of Total ESBTU FCVi = Sum of Coc, PAH_i / Coc, PAH_i, $FV_{i;\,i}$f Sum of Total ESBTU FCVi exceeds one, the mixture of PAHs in sediment may not be acceptable for the protection of benthic organisms.

Sum Total of ESBTU FCVi [3]								0.0831

This document shall not be disclosed without express written permission of U.S EPA

Table 3-11B
Derivation of Total PAH ESBs - May 2011 Duck Creek Sediment Samples
Duck and Otter Creeks Confluence Investigation
Toledo, Lucas County, Ohio

-- = Criterion or value not available
µg/g = Microgram per gram
µg/goc = Microgram per gram organic carbon
µg/kg = Microgram per kilogram

Coc = Concentration organic carbon
Conc = Concentration

FCVi = Final chronic value for individual PAH
foc = Fraction organic carbon
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits
LS = Low soil
Maxi = Maximum individual PAH

NA = Criterion or value not available
PAH = Polycyclic aromatic hydrocarbon
PAHi = Individual PAH
RL = Reporting limit
SIMS = Selective ion monitoring
SVOA = Semivolatile organic analysis
TOC = Total organic carbon
U = Coded data omitted from ESB calculations
wt = Weight
1 PAHs and corresponding Coc PAHi, FCVi, Coc PAHi, and Maxi values are from Table 3-4 in U.S. EPA 2003; example calculations provided in Table 6-3 in U.S. EPA 2003
2 Because COC exceeds COC, PAHi, Maxi , COC, PAHi, Maxi is substituted for COC to calculate ESBTU FCVi (see text).
3 Sum of Total ESBTU FCVi = Sum of Coc, PAH_i / Coc, PAH_i, $FV_{i;}$ if Sum of Total ESBTU FCVi exceeds one, the mixture of PAHs in sediment may not be acceptable for the protection of benthic organisms.

Sum IWTU			0.02		0.01		1.48

Notes:

Shaded results exceed sum of $IWTU_{FCV}$ greater than 1.0

Cporewater - concentration of porewater

FCV - final chronic value

g/ML - gram per milliliter

IWTU - interstitial water toxic unit

J - Estimated value. Concentration is below the reporting limit or it was found to exceed the reporting limit, but one or more quality control parameters were outside control limits.

µg/L - microgram per liter

ng/g - nanogram per gram

U - Not detected above the reporting limit.

a From Table 3-4. EPA (2003). Procedures for the Derivation of Equilibrium Partitioning Sediment Benchmarks (ESBs) for the Protection of Benthic Organisms: PAH Mixtures. EPA/600/R-02/013. Nov. 2003.

Notes:

Bold indicates most stringent criteria is exceeded; shading indicates least stringent criteria is exceeded.

OMZM - Outside mixing zone maximum

IMZM- Inside mixing zone maximum

IMZA - Inside mixing zone average

CMC = Criteria maximum concentration

CCC = Criteria chronic concentration

U - Not detected above the RL.

J - Estimated value. Concentration is below the reporting limit or it was found to exceed the reporting limit, but one or more quality control parameters were outside control limits.

mg/L - milligram per liter

SU - standard unit

a Used criteria for 300 mg/L hardness; average site hardness is 341 mg/L.

b National ambient water quality criteria (http://water.epa.gov/scitech/swguidance/standards/current/upload/nrwqc-2009.pdf)

WA. Office of Response and Restoration Division, National Oceanic and Atmospheric Administration. 34 pages.

Values presented are acute and chronic freshcwater values

(http://response.restoration.noaa.gov/book_shelf/122_NEW-SQuiRTs.pdf)

d Lake Erie Basin Aquatic Life and Human Health Tier I Criteria, Tier II Values and Screening Values (SV)

contained in and developed pursuant to Chapters 3745-1 and 3745-2 of the Ohio Administrative Code (OAC).

Table numbers within this table refer to Chapter 3745-1 of the OAC.

Ohio EPA, Division of Surface Water. 10/20/09

Notes:

Bold result exceeds sediment benchmark

-- = Criterion or value not available
ARCS PEC = U.S. EPA
ARCS NEC = U.S. EPA
Consensus PEC = Probable effect concentration from MacDonald and others 2000
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits
J+ = Likely to have a high bias
J- = Likely to have a low bias
mg/kg = Milligram per kilogram
NA = Not available
Ontario LEL = Ontario low-effect level from Persaud and others 1993
PQL = Practical quantitation limit
R = Data rejected because of quality control deficiencies
R3 BTAG = U.S. EPA Region 3 Biological Technical Assistance Group Freshwater Sediment Screening Benchmarks from http://www.epa.gov/reg3hwmd/risk/eco/index.htm
R4 = U.S
R5 ESL =
RL = Reporting limit
U = Not detected above RL
UJ = Not detected above RL; however, RL approximate

Notes:

Bold result exceeds PEC criterion

µg/kg = Microgram per kilogram

ID = Identification

J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits

NA = Not available

NJ = Analyte "tentatively identified"; associated numerical value represents approximate concentration

P = Flag used for pesticide and Aroclor target compounds when difference of detected concentrations between two GC columns (see Form X) exceeds 25%; lower of the two values reported on Form I and flagged "P"; "P" flag not used unless a compound is identified on both columns

PCB = Polychlorinated biphenyl

PEC = Probable effect concentration

PEC-Q = Probable effect concentration quotient = Total PCBs/PEC

RL = Reporting limit

Total PCBs = Sum of detected Aroclors

U = Not detected above RL

UJ = Not detected above RL; however, RL approximate

UJ = Not detected above RL; however, RL approximate

Notes:

Bold result exceeds low benchmark

Shaded result exceeds high benchmark

DRO = Diesel-range organics

FCV = Final chronic value

foc = Fraction organic carbon

GRO = Gasoline-range organics

ID = Identification

J = Estimated value

Koc = Organic carbon water partitioning coefficient

mg/kg = Milligram per kilogram

mg/L = Milligram per liter

RRO = Residual-range organics

TOC = Total organic carbon

U = Analyte not detected

1 The area under the chromatogram (including both aromatic and aliphatic hydrocarbons) between C6 and C10 is defined as GROs. The area under the chromatogram between C10 and C24 is defined as DROs. The area under the chromatogram less than C24 is defined as RROs (MDEP 2007).

2 The fraction is not likely toxic because mean LC_{50} exceeds mean aqueous solubility; on-line source: http://www.mass.gov/dep/cleanup/laws/tphbat.pdf

Sediment Benchmark (mg/kg) = Koc x FCV x foc (0.001)

Notes:
Bold = Sediment benchmark is exceeded
µg/kg = Microgram per kilogram
% = Percent
CBSQG 2000 = Consensus-based sediment quality guideline from MacDonald and others 2000
CCME 1999 = Canadian sediment quality guideline for the protection of aquatic life from CCME 1999
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits
NA = A criterion or value is not available
Ontario 1993 = Guideline for the protection and management of aquatic sediment from Peraud and others 1993
PAH = Polycyclic aromatic hydrocarbon
PEC = Probable effect concentration
RL = Reporting limit
TOC = Total organic carbon
U = Analyte not detected
WDNR 2003 = Consensus-based sediment quality guideline from WDNR 2003
[1] There are no guideline values for Benzo(e)pyrene.; used value for benzo(a)pyrene
[2] There are no guideline values for Benzo(b)fluoranthene; used value for benzo(b)fluoranthene
[3] There are no guideline values for perylene; used value for benzo(ghi)perylene

Table 3-16B
Comparison of Priority Pollutant PAH Concentrations to Sediment Benchmarks - May 2011 Otter Creek Confluence Sediment Samples
Duck and Otter Creeks Confluence Investigation
Toledo, Lucas County, Ohio

Notes:
Bold = Sediment benchmark is exceeded
µg/kg = Microgram per kilogram
% = Percent
CBSQG 2000 = Consensus-based sediment quality guideline from MacDonald and others 2000
CCME 1999 = Canadian sediment quality guideline for the protection of aquatic life from CCME 1999
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits

NA = A criterion or value is not available
Ontario 1993 = Guideline for the protection and management of aquatic sediment from Peraud and others 1993
PAH = Polycyclic aromatic hydrocarbon
PEC = Probable effect concentration
RL = Reporting limit
TOC = Total organic carbon
U = Analyte not detected
WDNR 2003 = Consensus-based sediment quality guideline from WDNR 2003
[1] There are no guideline values for Benzo(e)pyrene.; used value for benzo(a)pyrene
[2] There are no guideline values for Benzo(b)fluoranthene; used value for benzo(b)fluoranthene
[3] There are no guideline values for perylene; used value for benzo(ghi)perylene

Mean PEC-Q			0.26		0.18		0.20		0.21		0.27

Notes:
Bold result exceeds PEC-Q threshold of 0.5
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits
J+ = Likely to have a high bias
J- = Likely to have a low bias
Mean PEC-Q = Sum(PEC-Q) / No. of inorganics positively detected
mg/kg = Milligram per kilogram
R = Data rejected because of quality control deficiencies
RL = Report limit
PEC = Probable effect concentration from Ingersoll and others 2000
PEC-Q = Result / PEC
U = Not detected above RL
1 Only arsenic, cadmium, chromium, copper, lead, nickel, and zinc were used to determine the metals PEC-Q.

Notes:
µg/kg - Microgram per kilogram
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits
NA = Criterion or value not available
PAH = Polycyclic aromatic hydrocarbon
PEC = Probable effect concentration
PEC-Q = Probable effect concentration quotient
PPAH = Priority pollutant PAH
RL = Reporting limit
TOC = Total organic carbon
U = Not detected above RL

1 16 PPAHs include acenaphthene, acenaphthylene, anthracene, fluorene, naphthalene, phenanathrene, benzo(a)anthracene, benzo(a)pyrene, benzo(ghi)perylene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(ah)anthracene, indeno(1,2,3-cd)pyrene, fluoranthene, and pyrene.
2 For PAHs, the PEC-Q is normalized to 1% organic carbon by dividing the site concentration by the percent TOC.

This document shall not be disclosed without express written permission of U.S. EPA

Total organic carbon (%)	2.07	2.01
Total organic carbon (g/g)	0.0207	0.0201
(Sum SEM - AVS)/foc (µmols/g_{oc})	0.5	-127

Notes:
µmole/g = Micromole per gram
AVS = Acid volatile sulfide
foc = Fraction organic carbon
g/g = Gram per gram
goc = gram organic carbon
ID = Identification
J = Estimated value
RL = Reporting limit
SEM = Simultaneously extracted metals
s.u. = Standard unit
TOC = Total organic carbon
U = Not detected above RL
If SEM/AVS ratio < 1, the sediments are not toxic.
If AVS ≥ SEM (cadmium, copper, lead, nickel, silver, and zinc/2), then no biological effects from metals in sediment.

X(µg/mol) = X mg/kg / molecular weight
Molecular weights: sulfur, 32.06; nickel, 58.7; zinc, 65.4; cadmium, 112; lead, 207; copper, 63.5; silver, 108
Any sediment in which (SEM-AVS)/foc < 130 µmole/goc should pose low risk of adverse biological effects from cadmium copper, lead, nickel, and zinc.
Any sediment in which 130 µmole/goc < (SEM-AVS) /foc < 3,000 µmole/goc may have adverse biological effects from cadmium copper, lead, nickel, and zinc.
Any sediment in which (SEM-AVS)/foc > 3,000 µmole/goc may have adverse biological effects from cadmium copper, lead, nickel, and zinc.
Any sediment with AVS > 0.0 will not cause adverse biological effects from chromium or silver.

Sum Total of ESBTU FCVi[3]							**1.2985**					0.1620

This document shall not be disclosed without express written permission of U.S. EPA

Table 3-22A
Derivation of Total PAH ESB - November 2010 Otter Creek Confluence Sediment Samples
Duck and Otter Creeks Confluence Investigation
Toledo, Lucas County, Ohio

Notes:

% = Percent
µg/g = Microgram per gram
µg/g Oc = Microgram per gram organic carbon
µg/kg = Micrograms per kilograms
Coc = Concentration organic carbon
Conc = Concentration
ESB = Equilibrium partitioning sediment benchmark
ESBTU = Equilibrium partitioning sediment benchmark toxic unit
FCVi = Final chronic value for individual PAH
foc = Fraction organic carbon
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters were outside control limits
Maxi = Maximum individual PAH
MC =
NA = Criterion or value not available
PAH = Polycyclic aromatic hydrocarbon
PAHi = Individual PAH
RL = Reporting limit
TOC = Total organic carbon
U = Coded data omitted from ESB calculations
wt = Weight

[1] PAHs and corresponding Coc PAHi, FCVi and Coc PAHi, Maxi values are from Table 3-4 in EPA, 2003. Example calculations provided in Table 6-3 in EPA, 2003.

[2] Because COC exceeds COC,PAHi,Maxi , COC,PAHi,Maxi is substituted for COC to calculate ESBTUFCVi (see text).

[3] Sum of Total ESBTU FCVi = Sum of Coc, PAH_i / Coc, PAH_i, $FV_{i;}$. If Sum of Total ESBTU FCVi exceeds one, the mixture of PAHs in sediemtn may not be acceptable for the protection of benthic organisms.

Sum Total of ESBTU FCVi3						0.1491

Notes:
% = Percent
-- = A criterion or value is not available
µg/g = Microgram per gram
µg/g Oc = Microgram per gram organic carbon
µg/kg = Micrograms per kilograms
Coc = Concentration
Conc = Concentration
ESB = Equilibrium partitioning sediment benchmark
ESBTU = Equilibrium partitioning sediment benchmark toxic unit
FCVi = Final chronic value for individual PAH
foc = Fraction organic carbon
ID = Identification
J = Estimated value; concentration below RL or exceeded RL, but one or more quality control parameters
were outside control limits
LS = Low soil
MC =
Maxi = Maximum individual PAH
NA = Criterion or value not available
PAH = Polycyclic aromatic hydrocarbon
PAHi = Individual PAH
RL = Reporting limit
SIMS = Selective ion monitoring
SOVA = Semi volatile organic analysis
TOC = Total organic carbon
U = Coded data omitted from ESB calculations
wt = Weight
[1] PAHs and corresponding Coc PAHi, FCVi and Coc PAHi, Maxi values are from Table 3-4 in EPA, 2003. Example
[2] Because COC exceeds COC, PAHi, Maxi , COC, PAHi, Maxi is substituted for COC to calculate ESBTU FCVi (see text).
3 Sum of Total ESBTU FCVi = Sum of Coc, PAHi /Coc, PAHi, FVi;. If Sum of Total ESBTU FCVi exceeds one, the mixture of PAHs in sediment may not be acceptable for the protection of benthic organisms.

Notes:

Shaded results exceed sum of $IWTU_{FCV}$

Cporewater - concentration of porewater

FCV - final chronic value

g/ML - gram per milliliter

IWTU - interstitial water toxic unit

J - Estimated value. Concentration is below the reporting limit or it was found to exceed the reporting limit, but one or more quality control parameters were outside control limits.

µg/L - microgram per liter

ng/g - nanogram per gram

U - Not detected above the reporting limit.

a From Table 3-4. EPA (2003). Procedures for the Derivation of Equilibrium Partitioning Sediment Benchmarks (ESBs) for the Protection of Benthic Organisms: PAH Mixtures. EPA/600/R-02/013. Nov. 2003.

Notes:

Bold indicates most stringent criteria is exceeded; shading indicates least stringent criteria is exceeded.

OMZM - Outside mixing zone maximum

IMZM- Inside mixing zone maximum

IMZA - Inside mixing zone average

CMC = Criteria maximum concentration

CCC = Criteria chronic concentration

U - Not detected above the RL.

J - Estimated value. Concentration is below the reporting limit or it was found to exceed the reporting limit, but one or more quality control parameters were outside control limits.

mg/L - milligram per liter

SU - standard unit

a Used criteria for 300 mg/L hardness; average site hardness is 341 mg/L.

b National ambient water quality criteria (http://water.epa.gov/scitech/swguidance/standards/current/upload/nrwqc-2009.pdf)

c Buchman, M.F. 2008. NOAA Screening Quick Reference Table (SQUIRTs) NOAA OR&R Report 08-1, Seattle, WA. Office of Response and Restoration Division, National Oceanic and Atmospheric Administration. 34 pages. Values presented are acute and chronic freshcwater values (http://response.restoration.noaa.gov/book_shelf/122_NEW-SQuiRTs.pdf)

d Lake Erie Basin Aquatic Life and Human Health Tier I Criteria, Tier II Values and Screening Values (SV) contained in and developed pursuant to Chapters 3745-1 and 3745-2 of the Ohio Administrative Code (OAC). Table numbers within this table refer to Chapter 3745-1 of the OAC. Ohio EPA, Division of Surface Water. 10/20/09 http://www.epa.ohio.gov/portals/35/wqs/Erieval13.pdf.

Notes:

* (asterisk) and shading indicates statistically different results compared to control

% - percent

ERDC - Engineer Research and Development Center, United States Army Corps of Engineers

NA - not calculated due to zero percent survival

NC - original statistical evaluation was correct based on initial review, therefore there was no reason to re-run the statistical evaluation

(1) - value different than ERDC value

EXECUTIVE SUMMARY

The Great Lakes National Program Office (GLNPO) requested the Army Engineer Research and Development Center (ERDC) to conduct acute toxicity testing on sediments from Duck and Otter Creeks as part of its Great Lakes Legacy Act initiative. Eleven (11) sediments were evaluated using the midge *Chironomus dilutus*. This report summarizes the biological testing of sediment collected from Duck and Otter Creeks confluence sites conducted in basic accordance with guidance provided in "Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Freshwater Invertebrates" (USEPA 2000). Three separate experiments were conducted. Significant reduction in survival was detected in OC-26 and OC-27 sediment samples. Significant reductions in ash-free biomass per initial organism and ash-free dry weight per surviving organism were detected for sediment samples OC-26, OC-29 and OC-30. A significant reduction in ash-free dry weight per surviving organism was observed for sediment sample OC-28 (Tables 2-4). No significant effects on survival or biomass were detected for the remaining sediment samples evaluated.

INTRODUCTION

At the request of the USEPA Great Lakes National Program Office (GLNPO), the US Army Engineer Research and Development Center (ERDC) conducted sediment toxicity tests of bottom sediment collected from sites at the confluence of Duck and Otter Creeks. Duck and Otter Creeks are located in an industrialized area of Northwest Ohio. The creeks are part of the Maumee River watershed which empties into Lake Erie. The evaluations were conducted under the Great Lakes Legacy Act with support from the GLNPO. The evaluation consisted of whole sediment acute toxicity tests with the midge *Chironomus dilutus*. Studies were conducted in basic accordance with the guidance provided in "Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Freshwater Invertebrates" (USEPA 2000). The evaluation was conducted blind, in that the ERDC was unaware of the amounts or types of contaminants in the sediment samples and where they were collected.

TEST SEDIMENTS

Eleven (11) sediments were received by the ERDC in two (2) separate shipments. Shipments were received the 5th and 8th of November 2010. Sediments were immediately inspected, logged and placed in cold storage at 4°C where they remained until test initiation. Chain of custody sheets are provided in Appendix D. A list of sediment samples evaluated is provided in Table 1.

METHODS

Chironomus dilutus whole sediment toxicity bioassay

Chironomus dilutus 10-day sediment exposures were conducted in basic accordance with guidance provided in "Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Freshwater Invertebrates" (USEPA 2000). Due to logistics related to the number of samples tested, the study was divided into 3 separate experiments. Testing was initiated on the 19th of November 2010 and was completed on 23rd December 2010.

Egg masses were obtained from Environmental Consulting and Testing (Superior, WI) and maintained in culture until the correct age (~ 10 days old) organisms were available to initiate testing. On the day prior to test initiation, approximately 75 mL of each sediment was added to eight (8) replicate 300 mL beakers. Sediment from the University of Mississippi field station, (Oxford, MS) was included as a negative control. Beakers were placed in a temperature controlled water bath or environmental chamber at 23 °C and allowed to equilibrate over night. Pore water ammonia measurements were taken on sediments prior to addition to beakers. Pore water was collected by centrifuging 50 mL of each sediment at 3000 RPM for 15 minutes. Pore water analysis was performed on the supernatant of the centrifuged sediment. All pore water total ammonia concentrations were below the 20 mg/L guidance for freshwater organisms provided in the Inland Testing Manual (USEPA /USACE 1998) (Appendix B; Table B1).

Overlying water quality (temperature, pH, dissolved oxygen, hardness, alkalinity, conductivity and ammonia) was recorded for each replicate beaker at test initiation. Ten organisms were added to each replicate and 1 mL of a Tetrafin® food mixture was provided. Initial weights of all organisms added were within the 0.08 to 0.23 mg/individual dry weight range indicative of the correct developmental stage (USEPA 2000). Temperature and dissolved oxygen were measured daily on a single replicate of each sediment throughout the exposure period. Animals were fed 1 mL of a Tetrafin® food mixture and two full water renewals were conducted daily. Water renewals were conducted using a modified Zumwalt water renewal system (USEPA 2000) (Appendix A; Photo A1 and A2). To maintain dissolved oxygen levels, aeration was provided to each replicate.

On day 10, overlying water quality was measured and each replicate beaker was terminated by passing the sediment through a 425 µm screen. Surviving organisms were recovered and enumerated. Following enumeration organisms from each replicate were placed on pre-weighed pans and placed in a drying oven for 24 hours at 60 °C. Following the drying period, pans were removed from the oven and dry mass for each replicate was recorded. Pans were then placed in a muffle furnace at 550 °C for 2 hours. After 2 hours, pans were removed from the furnace allowed to cool and ash-free mass was recorded for each replicate.

Water quality parameters

The water quality during bioassay testing was measured using a Thermo Scientific Orion 4Star meter (Thermo Scientific**,** Beverly, MA) for electrical conductivity, a model 315i meter (WTW; Weilheim, Germany) for pH, and a model Oxi 330 meter (WTW; Weilheim, Germany) for dissolved oxygen (D.O.). Total overlying water ammonia, hardness and alkalinity were measured using LeMotte titration kits (Chestertown, MD, USA). Total pore water ammonia was measured using a 720A ion-selective electrode (ISE) meter (Thermo Orion Electron Corp., Beverly, MA) equipped with a 95-12 ammonia-sensitive electrode (Thermo Orion Electron Corp., Beverly, MA).

Statistical analysis

Data normality (Kolmogorov–Smirnov test), homogeneity (Levene's Test), and sediment differences compared to the control were conducted using SigmaStat software (Version 3.5, SPSS, Chicago, IL). Statistical significance was determined at $\alpha = 0.05$. Survival data were arcsine-square-root transformed prior to analysis. Where data were normal and homogenous, a One Way ANOVA was conducted followed by means comparison to the control using the Dunnett's mean comparison method. When normality was not achieved, the Kruskal–Wallis one-way ANOVA on ranks was applied followed by means comparison to the control using the Dunn's mean comparison procedure. Data endpoints analyzed were survival, weight per initial organism, ash-free weight per initial organism, dry weight per surviving organism and ash-free weight per surviving organism.

RESULTS

Water quality parameters for all bioassays were within the acceptability ranges specified by testing guidance (US EPA 2000) (Appendix B; Tables B2-B4). Survival in the negative control exceeded 78% in all tests and met the 70% minimum performance requirement indicated in testing guidance (US EPA 2000) (Tables 2-4).

Survival ranged from 0% to 87.5% in the sediment samples tested. Statistically significant reductions in survival relative to the control were detected in OC-26 and OC-27 sediments (Tables 3 and 4). Significant effects on ash-free biomass per initial organism were detected for sediments OC-26, OC-29 and OC-30. A significant reduction in ash-free dry weight per surviving organism was observed for sediment sample OC-28 (Tables 3 and 4). No significant effects on survival or the biomass endpoints examined were detected for sediments DC-13, DC-14, DC-16, DC-17, DC-19 and OC-31 (Tables 2-4).

Significant reductions in ash-free biomass per initial organism and ash-free dry weight per surviving organism were detected for sediment samples OC-26, OC-29 and OC-30. A significant reduction in ash-free dry weight per surviving organism was observed for sediment

sample OC-28 (Tables 2-4). No significant effects on survival or biomass were detected for the remaining sediment samples evaluated.

Table 2. Test 1 *Chironomus dilutus* mean survival and mass (± one standard deviation). Asterisks denote a statistically significant reduction in survival or mass relative to the control sediment.

Appendix D. Statistical analyses for *Chironomus dilutus* sediment bioassays

TEST 1

Test 1 Survival

One Way Analysis of Variance Sunday, January 09, 2011, 2:43:02 AM

Data source: Data 5 in Notebook 1

Normality Test: Failed (P = <0.001)

Test execution ended by user request, ANOVA on Ranks begun

Kruskal-Wallis One Way Analysis of Variance on Ranks Sunday, January 09, 2011, 2:43:02 AM

Data source: Data 5 in Notebook 1

Group	N	Missing	Median	25%	75%
Control	8	0	1.410	0.991	1.571
DC-6/7	8	0	1.178	1.049	1.571
DC-11/12	8	0	1.249	0.997	1.571
DC-13	8	0	1.249	1.178	1.571
OC-22	8	0	1.410	1.107	1.571
OC-24/25	8	0	1.178	1.049	1.571

H = 1.042 with 5 degrees of freedom. (P = 0.959)

The differences in the median values among the treatment groups are not great enough to exclude the possibility that the difference is due to random sampling variability; there is not a statistically significant difference (P = 0.959)

Test 1 Dry Biomass per Initial Organism

One Way Analysis of Variance Sunday, February 13, 2011, 6:01:15 PM

Data source: Test 3 Dry and Ash-free Biomass per Initial Organism Data in Stats(2-13-11)

Dependent Variable: DBM/IO

Normality Test: Passed (P = 0.877)

Equal Variance Test: Failed (P < 0.050)

Test execution ended by user request, ANOVA on Ranks begun

Kruskal-Wallis One Way Analysis of Variance on Ranks Sunday, February 13, 2011, 6:01:15 PM

Data source: Test 3 Dry and Ash-free Biomass per Initial Organism Data in Stats(2-13-11)

Group	N	Missing	Median	25%	75%
Control	8	0	3.837	2.021	5.483
DC-6/7	8	0	2.636	2.073	2.818
DC-11/12	8	0	1.979	1.770	2.451
DC-13	8	0	3.867	2.298	4.280
OC-22	8	0	3.071	2.780	3.976
OC-24/25	8	0	3.237	2.507	3.881

H = 10.028 with 5 degrees of freedom. (P = 0.074)

The differences in the median values among the treatment groups are not great enough to exclude the possibility that the difference is due to random sampling variability; there is not a statistically significant difference (P = 0.074)

Test 1 Ash-free Biomass per Initial Organism

One Way Analysis of Variance Sunday, February 13, 2011, 6:02:38 PM

Data source: Test 3 Dry and Ash-free Biomass per Initial Organism Data in Stats(2-13-11)

Dependent Variable: ABM/IO

Normality Test: Passed (P = 0.597)

Equal Variance Test: Failed (P < 0.050)

Test execution ended by user request, ANOVA on Ranks begun

Kruskal-Wallis One Way Analysis of Variance on Ranks Sunday, February 13, 2011, 6:02:38 PM

Data source: Test 3 Dry and Ash-free Biomass per Initial Organism Data in Stats(2-13-11)

Group	N	Missing	Median	25%	75%
Control	8	0	2.831	1.486	4.177
DC-6/7	8	0	1.956	1.555	2.071
DC-11/12	8	0	1.431	1.332	1.899
DC-13	8	0	2.922	1.578	3.179
OC-22	8	0	2.374	2.095	2.936
OC-24/25	8	0	2.290	1.895	2.944

H = 8.749 with 5 degrees of freedom. (P = 0.120)

The differences in the median values among the treatment groups are not great enough to exclude the possibility that the difference is due to random sampling variability; there is not a statistically significant difference (P = 0.120)

Test 1 Individual Dry Mass

One Way Analysis of Variance Sunday, January 30, 2011, 8:48:13 PM

Data source: Test 3 Mass Data in Stats

Dependent Variable: D-Mass

Normality Test: Passed (P = 0.153)

Equal Variance Test: Passed (P = 0.202)

Group Name	N	Missing	Mean	Std Dev	SEM
Control	8	0	4.164	1.400	0.495
DC-6/7	8	0	3.263	1.010	0.357
DC-11/12	8	0	2.597	0.915	0.323
DC-13	8	0	3.893	1.049	0.371
OC-22	8	0	3.558	0.743	0.263
OC-24/25	8	0	3.755	0.855	0.302

Source of Variation	DF	SS	MS	F	P
Between Groups	5	12.211	2.442	2.364	0.056
Residual	42	43.396	1.033		
Total	47	55.607			

The differences in the mean values among the treatment groups are not great enough to exclude the possibility that the difference is due to random sampling variability; there is not a statistically significant difference (P = 0.056).

Test 1 Individual Ash-Free Mass

One Way Analysis of Variance Sunday, January 09, 2011, 2:44:01 AM

Data source: Data 6 in Notebook 1

Normality Test: Passed (P > 0.050)

Equal Variance Test: Passed (P = 0.143)

Group Name	N	Missing	Mean	Std Dev	SEM
Control	8	0	3.098	1.118	0.395
DC-6/7	8	0	2.424	0.732	0.259
DC-11/12	8	0	1.921	0.718	0.254
DC-13	8	0	2.915	0.895	0.316
OC-22	8	0	2.642	0.548	0.194
OC-24/25	8	0	2.733	0.582	0.206

Source of Variation	DF	SS	MS	F	P
Between Groups	5	6.845	1.369	2.196	0.073
Residual	42	26.188	0.624		
Total	47	33.033			

The differences in the mean values among the treatment groups are not great enough to exclude the possibility that the difference is due to random sampling variability; there is not a statistically significant difference (P = 0.073).

TEST 2

Test 2 Survival

One Way Analysis of Variance Sunday, January 09, 2011, 2:48:46 AM

Data source: Data 7 in Stats

Normality Test: Passed (P > 0.050)

Equal Variance Test: Failed (P = 0.006)

Test execution ended by user request, ANOVA on Ranks begun

Kruskal-Wallis One Way Analysis of Variance on Ranks Sunday, January 09, 2011, 2:48:46 AM

Data source: Data 7 in Stats

Group	N	Missing	Median	25%	75%
Control	8	0	1.107	1.107	1.178
DC-14	8	0	1.178	1.049	1.410
DC-16	8	0	1.178	0.991	1.571
DC-17	8	0	1.178	1.049	1.410
DC-19	8	0	1.049	0.991	1.178
OC-26	8	0	0.232	0.000	0.632

H = 21.174 with 5 degrees of freedom. (P = <0.001)

The differences in the median values among the treatment groups are greater than would be expected by chance; there is a statistically significant difference (P = <0.001)

To isolate the group or groups that differ from the others use a multiple comparison procedure.

Multiple Comparisons versus Control Group (Dunnett's Method) :

Comparison	Diff of Ranks	q'	P<0.05
OC-26 vs Control	184.000	3.286	Yes
DC-19 vs Control	38.500	0.688	No
DC-17 vs Control	22.000	0.393	Do Not Test
DC-16 vs Control	20.000	0.357	Do Not Test
DC-14 vs Control	18.500	0.330	Do Not Test

Note: The multiple comparisons on ranks do not include an adjustment for ties.

Test 2 Dry Biomass per Initial Organism

One Way Analysis of Variance Sunday, February 13, 2011, 6:06:44 PM

Data source: Test 4 Dry and Ash-free Biomass per Initial Organism Data in Stats(2-13-11)

Dependent Variable: DBM/IO

Normality Test: Passed (P = 0.524)

Equal Variance Test: Passed (P = 0.126)

Group Name	N	Missing	Mean	Std Dev	SEM
Control	8	0	2.553	0.841	0.297
DC-14	8	0	2.498	1.306	0.462
DC-16	8	0	2.864	0.482	0.170
DC-17	8	0	2.736	0.822	0.291
DC-19	8	0	2.637	0.914	0.323
OC-26	4	0	0.234	0.0831	0.0415

Source of Variation	DF	SS	MS	F	P
Between Groups	5	22.041	4.408	5.754	<0.001
Residual	38	29.114	0.766		
Total	43	51.155			

The differences in the mean values among the treatment groups are greater than would be expected by chance; there is a statistically significant difference (P = <0.001).

Multiple Comparisons versus Control Group (Dunnett's Method) :

Comparisons for factor: **Sediment**

Comparison	Diff of Means	q'	P	P<0.050
Control vs. OC-26	2.319	4.326	--	Yes
Control vs. DC-16	0.311	0.710	--	No
Control vs. DC-17	0.183	0.418	--	Do Not Test
Control vs. DC-19	0.0841	0.192	--	Do Not Test
Control vs. DC-14	0.0551	0.126	--	Do Not Test

Note: The P values for Dunnett's and Duncan's tests are currently unavailable except for reporting that the P's are greater or less than the critical values of .05 and .01.

A result of "Do Not Test" occurs for a comparison when no significant difference is found between two means that enclose that comparison. For example, if you had four means sorted in order, and found no difference between means 4 vs. 2, then you would not test 4 vs. 3 and 3 vs. 2, but still test 4 vs. 1 and 3 vs. 1 (4 vs. 3 and 3 vs. 2 are enclosed by 4 vs. 2: 4 3 2 1). Note that not testing the enclosed means is a procedural rule, and a result of Do Not Test should be treated as if there is no significant difference between the means, even though one may appear to exist.

Test 2 Ash-free Biomass Per Initial Organism

One Way Analysis of Variance Sunday, February 13, 2011, 6:08:24 PM

Data source: Test 4 Dry and Ash-free Biomass per Initial Organism Data in Stats(2-13-11)

Dependent Variable: ABM/IO

Normality Test: Passed (P = 0.743)

Equal Variance Test: Passed (P = 0.225)

Group Name	N	Missing	Mean	Std Dev	SEM
Control	8	0	1.759	0.639	0.226
DC-14	8	0	1.679	0.791	0.280
DC-16	8	0	1.925	0.420	0.148
DC-17	8	0	1.858	0.571	0.202
DC-19	8	0	1.785	0.581	0.205
OC-26	4	0	0.155	0.0514	0.0257

Source of Variation	DF	SS	MS	F	P
Between Groups	5	10.139	2.028	5.867	<0.001
Residual	38	13.133	0.346		
Total	43	23.272			

The differences in the mean values among the treatment groups are greater than would be expected by chance; there is a statistically significant difference (P = <0.001).

Multiple Comparisons versus Control Group (Dunnett's Method) :

Comparisons for factor: **Sediment**

Comparison	Diff of Means	q'	P	P<0.050
Control vs. OC-26	1.604	4.457	--	Yes
Control vs. DC-16	0.166	0.564	--	No
Control vs. DC-17	0.0982	0.334	--	Do Not Test
Control vs. DC-14	0.0806	0.274	--	Do Not Test
Control vs. DC-19	0.0255	0.0868	--	Do Not Test

Note: The P values for Dunnett's and Duncan's tests are currently unavailable except for reporting that the P's are greater or less than the critical values of .05 and .01.

A result of "Do Not Test" occurs for a comparison when no significant difference is found between two means that enclose that comparison. For example, if you had four means sorted in order, and found no difference between means 4 vs. 2, then you would not test 4 vs. 3 and 3 vs. 2, but still test 4 vs. 1 and 3 vs. 1 (4 vs. 3 and 3 vs. 2 are enclosed by 4 vs. 2: 4 3 2 1). Note that not testing the enclosed means is a procedural rule, and a result of Do Not Test should be treated as if there is no significant difference between the means, even though one may appear to exist.

Test 2 Individual Dry Mass

One Way Analysis of Variance Sunday, January 30, 2011, 8:46:23 PM

Data source: Test 4 Mass Data in Stats

Dependent Variable: D-Mass

Normality Test: Passed (P = 0.514)

Equal Variance Test: Passed (P = 0.329)

Group Name	N	Missing	Mean	Std Dev	SEM
Control	8	0	3.469	1.050	0.371
DC-14	8	0	3.038	1.172	0.414
DC-16	8	0	3.514	0.828	0.293
DC-17	8	0	3.295	0.956	0.338
DC-19	8	0	3.545	0.684	0.242
OC-26	4	0	0.700	0.187	0.0933

Source of Variation	DF	SS	MS	F	P
Between Groups	5	27.383	5.477	6.523	<0.001
Residual	38	31.906	0.840		
Total	43	59.290			

The differences in the mean values among the treatment groups are greater than would be expected by chance; there is a statistically significant difference (P = <0.001).

Multiple Comparisons versus Control Group (Dunnett's Method) :

Comparisons for factor: **Sediment**

Comparison	Diff of Means	q'	P	P<0.050
Control vs. OC-26	2.769	4.935	--	Yes
Control vs. DC-14	0.432	0.942	--	No
Control vs. DC-17	0.174	0.380	--	Do Not Test
Control vs. DC-19	0.0754	0.165	--	Do Not Test
Control vs. DC-16	0.0448	0.0979	--	Do Not Test

Note: The P values for Dunnett's and Duncan's tests are currently unavailable except for reporting that the P's are greater or less than the critical values of .05 and .01.

A result of "Do Not Test" occurs for a comparison when no significant difference is found between two means that enclose that comparison. For example, if you had four means sorted in order, and found no difference between means 4 vs. 2, then you would not test 4 vs. 3 and 3 vs. 2, but still test 4 vs. 1 and 3 vs. 1 (4 vs. 3 and 3 vs. 2 are enclosed by 4 vs. 2: 4 3 2 1). Note that not testing the enclosed means is a procedural rule, and a result of Do Not Test should be treated as if there is no significant difference between the means, even though one may appear to exist.

Test 2 Individual Ash-free Mass

One Way Analysis of Variance Sunday, January 09, 2011, 2:50:42 AM

Data source: Data 8 in Stats

Normality Test: Passed (P > 0.050)

Equal Variance Test: Passed (P = 0.486)

Group Name	N	Missing	Mean	Std Dev	SEM

Residual	38	14.925	0.393		
Total	43	27.786			

The differences in the mean values among the treatment groups are greater than would be expected by chance; there is a statistically significant difference (P = <0.001).

Multiple Comparisons versus Control Group (Dunnett's Method) :

Comparisons for factor: **Sediment**

Comparison	Diff of Means	q'	P	P<0.050
Control vs. OC-26	1.930	5.030	--	Yes
Control vs. DC-14	0.343	1.096	--	No
Control vs. DC-17	0.147	0.468	--	Do Not Test
Control vs. DC-16	0.0418	0.133	--	Do Not Test
Control vs. DC-19	0.0196	0.0626	--	Do Not Test

Note: The P values for Dunnett's and Duncan's tests are currently unavailable except for reporting that the P's are greater or less than the critical values of .05 and .01.

A result of "Do Not Test" occurs for a comparison when no significant difference is found between two means that enclose that comparison. For example, if you had four means sorted in order, and found no difference between means 4 vs. 2, then you would not test 4 vs. 3 and 3 vs. 2, but still test 4 vs. 1 and 3 vs. 1 (4 vs. 3 and 3 vs. 2 are enclosed by 4 vs. 2: 4 3 2 1). Note that not testing the enclosed means is a procedural rule, and a result of Do Not Test should be treated as if there is no significant difference between the means, even though one may appear to exist.

TEST 3

Test 3 Survival

One Way Analysis of Variance Sunday, January 09, 2011, 2:55:01 AM

Data source: Data 9 in Stats

Normality Test: Passed (P > 0.050)

Equal Variance Test: Passed (P = 0.339)

Group Name	N	Missing	Mean	Std Dev	SEM
Control	8	0	1.102	0.128	0.0451
OC-28	8	0	1.216	0.250	0.0883
OC-29	8	0	0.960	0.150	0.0532
OC-30	8	0	0.922	0.299	0.106
OC-31	8	0	1.033	0.366	0.129

Source of Variation	DF	SS	MS	F	P
Between Groups	4	0.442	0.111	1.701	0.172
Residual	35	2.274	0.0650		
Total	39	2.716			

The differences in the mean values among the treatment groups are not great enough to exclude the possibility that the difference is due to random sampling variability; there is not a statistically significant difference (P = 0.172).

Test 3 Dry Biomass per Initial Organism

One Way Analysis of Variance Sunday, February 13, 2011, 6:11:05 PM

Data source: Test 5 Dry and Ash-free Biomass per Initial Organism Data in Stats(2-13-11)

Dependent Variable: DBM/IO

Normality Test: Failed (P < 0.050)

Test execution ended by user request, ANOVA on Ranks begun

Kruskal-Wallis One Way Analysis of Variance on Ranks Sunday, February 13, 2011, 6:11:05 PM

Data source: Test 5 Dry and Ash-free Biomass per Initial Organism Data in Stats(2-13-11)

Group	N	Missing	Median	25%	75%
Control	8	0	1.376	1.092	1.745
OC-28	8	0	0.641	0.448	0.715
OC-29	8	0	0.130	0.111	0.137
OC-30	8	0	0.128	0.0946	0.200
OC-31	8	0	1.007	0.553	1.278

H = 27.697 with 4 degrees of freedom. (P = <0.001)

The differences in the median values among the treatment groups are greater than would be expected by chance; there is a statistically significant difference (P = <0.001)

To isolate the group or groups that differ from the others use a multiple comparison procedure.

Multiple Comparisons versus Control Group (Dunn's Method) :

Comparison	Diff of Ranks	Q	P<0.05
OC-29 vs Control	25.125	4.298	Yes
OC-30 vs Control	24.875	4.256	Yes
OC-28 vs Control	11.250	1.925	No
OC-31 vs Control	8.750	1.497	Do Not Test

Note: The multiple comparisons on ranks do not include an adjustment for ties.

Test 3 Ash-free Biomass per Initial Organism

One Way Analysis of Variance Sunday, February 13, 2011, 6:12:52 PM

Data source: Test 5 Dry and Ash-free Biomass per Initial Organism Data in Stats(2-13-11)

Dependent Variable: ABM/IO

Normality Test: Failed (P < 0.050)

Test execution ended by user request, ANOVA on Ranks begun

Kruskal-Wallis One Way Analysis of Variance on Ranks Sunday, February 13, 2011, 6:12:52 PM

Data source: Test 5 Dry and Ash-free Biomass per Initial Organism Data in Stats(2-13-11)

Group	N	Missing	Median	25%	75%
Control	8	0	1.010	0.836	1.308
OC-28	8	0	0.480	0.332	0.539
OC-29	8	0	0.0964	0.0833	0.104
OC-30	8	0	0.0970	0.0699	0.148
OC-31	8	0	0.760	0.420	0.944

H = 27.799 with 4 degrees of freedom. (P = <0.001)

The differences in the median values among the treatment groups are greater than would be expected by chance; there is a statistically significant difference (P = <0.001)

To isolate the group or groups that differ from the others use a multiple comparison procedure.

Multiple Comparisons versus Control Group (Dunn's Method) :

Comparison	Diff of Ranks	Q	P<0.05
OC-29 vs Control	25.375	4.341	Yes
OC-30 vs Control	25.000	4.277	Yes
OC-28 vs Control	11.750	2.010	No
OC-31 vs Control	9.125	1.561	Do Not Test

Note: The multiple comparisons on ranks do not include an adjustment for ties.

Test 3 Individual Dry Mass

One Way Analysis of Variance Sunday, January 30, 2011, 8:36:52 PM

Data source: Test 5 Mass Data in Stats

Dependent Variable: D-Mass

Normality Test: Failed (P < 0.050)

Test execution ended by user request, ANOVA on Ranks begun

Kruskal-Wallis One Way Analysis of Variance on Ranks Sunday, January 30, 2011, 8:36:52 PM

Data source: Test 5 Mass Data in Stats

Group	N	Missing	Median	25%	75%
Control	8	0	1.743	1.551	2.054
OC-28	8	0	0.789	0.593	0.807
OC-29	8	0	0.186	0.171	0.221
OC-30	8	0	0.276	0.192	0.310
OC-31	8	0	1.218	0.922	1.537

H = 34.458 with 4 degrees of freedom. (P = <0.001)

The differences in the median values among the treatment groups are greater than would be expected by chance; there is a statistically significant difference (P = <0.001)

To isolate the group or groups that differ from the others use a multiple comparison procedure.

Multiple Comparisons versus Control Group (Dunn's Method) :

Comparison	Diff of Ranks	Q	P<0.05
OC-29 vs Control	29.125	4.983	Yes
OC-30 vs Control	25.375	4.341	Yes
OC-28 vs Control	14.250	2.438	No
OC-31 vs Control	7.500	1.283	Do Not Test

Note: The multiple comparisons on ranks do not include an adjustment for ties.

Test 3 Individual Ash-Free Mass

One Way Analysis of Variance Sunday, January 09, 2011, 3:06:42 AM

Data source: Data 10 in Stats

Normality Test: Failed (P = <0.001)

Test execution ended by user request, ANOVA on Ranks begun

Kruskal-Wallis One Way Analysis of Variance on Ranks Sunday, January 09, 2011, 3:06:42 AM

Appendix F. Data Sheets for *Chironomus dilutus* sediment toxicity bioassays

Testing for Duck and Otter Creeks data gap and confluence site investigations were conducted simultaneously. The test number in the data sheets corresponds to when the sediments were evaluated. For the confluence site investigation, tests 1, 2, and 3 described in the report correspond with test 3, 4, and 5 in the data sheets.

TEST 1

Initial Growth Information

Project: GLNPO-Otter and Duck Creek test 3

Day: 0 **Initials of Technician performing masss determinations:** DF

Daily Observations

Day: -1

Date: 11/18/16 **Technician Initials:** DF, DM
Time: PM

Water exchange counter: N/A

Comments: Mixed sediments until homogenous with lightnin mixer. Added sediment to beakers as described in EPA guidance. Sediment descriptions are as follows: DC-11/12 - fine/silty sed. containing gravel & twigs. OC-22 fine silty sediment with little organic matter. DC-6/7 - fine sediment with gravel & twigs. OC-24/25 light in color, sandy. DC-13 sandy. Beakers with bacterial die to D.O. issues encountered in the previous 2 tests. Measured parameter NH_3.

Day: 0

Date: 11/19/16 **Technician Initials:** DF, DM
Time: PM

Water exchange counter: N/A

Comments: Recorded WQ parameters. Added 10 mL/L larvae to each beaker. Test setup as described in EPA guidance document. Initials placed on pre-labeled pens.

Daily Observations

Day: 1

Date: 11/2016 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: AM & PM water exchange conducted, aeration adjusted. Daily parameters recorded, Animals fed, Tube building animal behavior appear normal.

Day: 2

Date: 11/21/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: AM & PM water exchanges conducted. Daily parameters recorded. Animals fed. Aeration adjusted

Daily Observations

Day: 3

Date: 11/22/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: Water exchange conducted. Daily parameters recorded. Animals fed. Adjusted aeration rate down.

Day: 4

Date: 11/23/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: Am & Pm water exchange conducted. Daily parameter recorded. Animals fed.

Daily Observations

Day: 5

Date: 11/24/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: Water exchange conducted, Parameters recorded - Animals fed.

Day: 6

Date: 11-25-10 **Technician Initials:** JS

Time: 7:00

Water exchange counter:

Comments: Water change, aeration good on all beakers. Last feed.

Daily Observations

Day: 7

Date: 11/26/10 **Technician Initials:** DV

Time: 1400

Water exchange counter: N/A

Comments: Water exchange conducted. Daily parameters recorded, animals fed.

Day: 8

Date: 11/27/10 **Technician Initials:** T.F.M.

Time: 1600

Water exchange counter: N/A

Comments: MODULE TEMP. @ 22.2°C, AERATION O.K., TEST FED. Parameters recorded,

Daily Observations

Day: 9

Date: 11/28/16 **Technician Initials:** DF

Time: _____

Water exchange counter: N/A

Comments: Water exchange conducted. Parameters recorded. Animals fed. Animal behavior appears normal

Day: 10

Date: 11/29/16 **Technician Initials:** DF

Time: PM

Water exchange counter: N/A

Comments: Test terminated as described in EPA guidance document.

Daily Observations

Day: -1

Date: 12/7/11 (DF) **Technician Initials:** DF, DM
Time: ~~Arctic~~ AM

Water exchange counter: N/A

Comments: Added Sediment to 2 week exposure Chambers. Chambers placed in water bath at 23°C. Aeration provided to each chamber. All sediments smelt without odor except OC-26 which had a strong Chemical smell

Day: 0

Date: 12/10/11. **Technician Initials:** DK, JW
Time: AM/PM

Water exchange counter: N/A

Comments: Test organisms added to each exposure Chamber. Filtering WQ parameters; Organisms collected for initial WQ measurements ~~Chamber placed~~ (DF) Water exchange conducted prior to WQ measurements & addition of organisms. Organisms fed. Test setup as described in EPA Guidance.

Daily Observations

Day: 1

Date: 12/11/16 **Technician Initials:** DF

Time: ~~AM~~ PM AM/PM

Water exchange counter: N/A

Comments: AM & PM water changes conducted. Organisms fed. Daily WQ recorded, Aeration adjusted.

Day: 2

Date: 12/12/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: AM & PM water exchange conducted. Daily WQ parameters recorded. Organisms fed. Aeration adjusted.

Daily Observations

Day: 3

Date: 12/13/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: Daily water exchanges conducted. Water Quality parameters recorded. Animals fed. No unusual animal behavior observed.

Day: 4

Date: 12/14/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: Daily water quality parameters recorded. Daily water exchanges conducted & Animals fed.

Daily Observations

Day: 5

Date: 12/15/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: AM & PM water exchange conducted. Daily parameters recorded. Animals fed.

Day: 6

Date: 12/16/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: AM & PM water exchange conducted. Daily parameters recorded. Animals fed. Control beakers cloudy.

Daily Observations

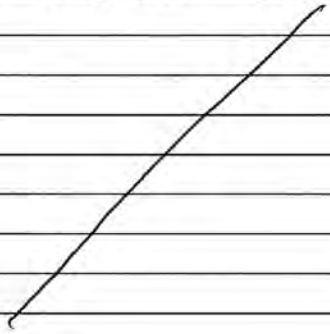
Day: 7

Date: 12/17/10 **Technician Initials:** DF

Time: Am/Pm

Water exchange counter: N/A

Comments: Water exchanger conducted (Am/Pm). Daily parameters recorded. Animals fed. Aeration observed



Day: 8

Date: 12/18/10 **Technician Initials:** DF

Time: Am/Pm

Water exchange counter: N/A

Comments: Am & Pm water exchanges Cond-dail. Daily parameters recorded. Animals fed. Aeration ok.

Daily Observations

Day: 9

Date: 12/19/10 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: Water exchanges conducted. Daily WQ recorded. Animals fed.

Day: 10

Date: 12/20/10 **Technician Initials:** DF, JL, JS

Time: AM

Water exchange counter: NA

Comments: WQ Parameter recorded on all beakers. TCH broken down as described in EPA Sediment document. No problems encountered.

Daily Observations

Day: -1

Date: 12/12/10 **Technician Initials:** DF
Time: AM

Water exchange counter: N/A

Comments: Sediment added to beakers (75ml per beaker), Dechlorinated water added to each beaker. Beakers placed in water bath at 23°C and placed on air to equilibrate overnight. Temp ref at 23°C.

Day: 0

Date: 12/13/10 **Technician Initials:** DF
Time: AM

Water exchange counter: N/A

Comments: Water exchange conducted on all beakers WQ parameters recorded. Ten chironomid larvae added to each beaker.

Daily Observations

Day: 1

Date: 12/14/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: Conducted AM & PM water exchange. Recorded daily parameters. Fed animals

Day: 2

Date: 12/15/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: Recorded daily WQ Parameters. Performed AM & PM water exchanges fed organisms. additional aeration.

Daily Observations

Day: 3

Date: 12/16/16 **Technician Initials:** DF

Time: Am/Pm

Water exchange counter: N/A

Comments: Daily water quality parameters recorded, water exchanges conducted. Animals fed.

Day: 4

Date: 12/17/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: Daily WQ recorded, water exchanges (AM/PM) conducted. Organisms fed.

Daily Observations

Day: 5

Date: 12/16/16 **Technician Initials:** DK

Time: Am/Pm

Water exchange counter: N/A

Comments: Recorded daily WQ parameters. Performed twice daily water exchanges. Organisms fed, cultures adjusted.

Day: 6

Date: 12/17/16 **Technician Initials:** DF

Time: Am/Pm

Water exchange counter: N/A

Comments: Daily WQ recorded Am & Pm water exchanges Conducted, organisms fed,

Daily Observations

Day: 7

Date: 12/20/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: Recorded daily WQ parameters. Performed AM & PM water exchanges. Fed organisms. Control beakers cloudy.

Day: 8

Date: 12/21/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: Daily WQ recorded. Water exchanges conducted. Organisms fed.

Daily Observations

Day: 9

Date: 12/22/16 **Technician Initials:** DF

Time: AM/PM

Water exchange counter: N/A

Comments: Recorded Daily WQ parameters. Water exchanges conducted. Animals fed.

Day: 10

Date: 12/23/16 **Technician Initials:** DF

Time: AM

Water exchange counter: N/A

Comments: Final water quality recorded for all beakers. Test broken down as described in EPA guidance. No problems encountered.

Toxicity Test Review
Duck and Otter Creek Confluences
Brian Mastin, PhD
Weston Solutions, Inc.

Acute Toxicity Evaluation of Duck and Otter Creek Sediments with C*hironomus dilutus* (Confluence Site Investigation, 4-29-11)

- Unusual to break the test into 3 separate events on different dates when all of the samples arrived around the same time.
- Reference toxicant information and test results are not reported.
- Seventy-five milliliters of sediment was used for each test replicate compared to 100-mL identified in the test protocol.
- There was not a section to cover protocol deviations.
- Water quality data sheets don't indicate which replicate the water quality was taken from for Days 1-9.

Acute Toxicity Evaluation of Duck and Otter Creek Sediments with C*hironomus dilutus* (Confluence Site Investigation Part 2, 10-12-11)

- There appears to be a long sample holding time, although not necessarily out of compliance. Sediment samples were received 5/13/11 and testing initiated 9/6/11.
- Reference toxicant information and test results are not reported.
- Seventy-five milliliters of sediment was used for each test replicate compared to 100-mL identified in the test protocol.
- There was not a section to cover protocol deviations.
- Water quality data sheets don't indicate which replicate the water quality was taken from for Days 1-9.
- The water renewal delivery system appears to have changed and looks quite a bit different from each other from the picture in each report.
- The results summary table format is different between reports as thus confusing. A summary table is definitely required for this report.

Statistical analyses:
There are a few discrepancies between the statistical results for survival, growth and biomass using SigmaStat (ERDC) compared to ToxCalc (Weston) for Duck and Otter Creek confluence samples. There also appears to be a discrepancy between results dependent on the number of stations simultaneously evaluated in either program. In this case, the more conservative approach is to compare the results of each station with the appropriate control and minimize the increased variability among stations that clouds the ability of the statistical evaluation to detect differences. Weston re-ran the statistics for all confluence data and presented their findings in comparison to ERDC's.

EXECUTIVE SUMMARY

The Great Lakes National Program Office (GLNPO) requested the Army Engineer Research and Development Center (ERDC) to conduct acute toxicity testing on sediments from Duck and Otter Creeks as part of its Great Lakes Legacy Act initiative. Eleven (11) sediments were evaluated using the midge *Chironomus dilutus*. This report summarizes the biological testing of sediment collected from Duck and Otter Creeks confluence sites conducted in basic accordance with guidance provided in "Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Freshwater Invertebrates" (USEPA 2000). A significant reduction in survival was detected in the OC-42 sediment sample. Significant reductions in total biomass per initial organism were detected for sediment samples DC-25 and OC-38 (Table 2). Significant reductions in total biomass per initial organism and as-free dry weight per surviving organism were detected for sediment samples OC-42, OC-44 and OC-46. No significant effects on survival or biomass/weight were detected for the remaining sediment samples evaluated.

INTRODUCTION

At the request of the USEPA Great Lakes National Program Office (GLNPO), the US Army Engineer Research and Development Center (ERDC) conducted sediment toxicity tests of bottom sediment collected from the Duck and Otter Creek confluence site. This study represents a second series of sediment testing at the confluence site with the initial testing occurring in November and December of 2010. Duck and Otter Creeks are located in an industrialized area of Northwest Ohio. The creeks are part of the Maumee River watershed which empties into Lake Erie. The evaluations were conducted under the Great Lakes Legacy Act with support from the GLNPO. The evaluation consisted of a whole sediment acute toxicity test with the midge *Chironomus dilutus*. The study was conducted in basic accordance with the guidance provided in "Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Freshwater Invertebrates" (USEPA 2000).

TEST SEDIMENTS

Eleven (11) sediments were received by the ERDC. All sediments were received 13 May 2011. Sediments were immediately inspected, logged and placed in cold storage at 4°C where they remained until test initiation. Chain of custody sheets are provided in Appendix D. A list of sediment samples evaluated is provided in Table 1.

Table 1. Summary of the test sediments and sediment identification.

METHODS

Chironomus dilutus 10-day sediment exposures were conducted in basic accordance with guidance provided in "Methods for Measuring the Toxicity and Bioaccumulation of Sediment-

associated Contaminants with Freshwater Invertebrates" (USEPA 2000). Testing was conducted 6-16 September 2011.

Egg masses were obtained from Environmental Consulting and Testing (Superior, WI) and maintained in culture until the correct age (~ 10 days old) organisms were obtained to initiate testing. On test day -4 approximately 75 mL of each sediment was added to eight (8) replicate 300 mL beakers (Appendix A; Photo A2). Sediment from the University of Mississippi field station, (Oxford, MS) was included as a negative control. Overlying water was added and beakers were placed in a temperature controlled environmental chamber at 23 °C and allowed to equilibrate for two days without water exchange. Two daily water exchanges were conducted on test day -1. On test day 0, pore water ammonia measurements were taken on sediments prior to addition of organisms. Pore water was collected by centrifuging 50 mL of each sediment at 3000 RPM for 15 minutes. Pore water analysis was performed on the supernatant of the centrifuged sediment.

Overlying water quality (temperature, pH, dissolved oxygen (DO), hardness, alkalinity, conductivity and ammonia) was recorded for each replicate beaker at test initiation. Ten organisms were randomly added to each replicate and 1 mL of a Tetrafin® food mixture (6 mg Tetrafin/mL) was provided. Initial dry and ash-free dry weights were determined on a subset of 40 organisms not used in testing. Initial weights of midges sampled from the pool of larvae used in testing were within the 0.08 to 0.23 mg/individual dry weight range indicative of the correct developmental stage (USEPA 2000) (Table 2). Temperature and DO were measured daily on a single replicate of each sediment throughout the exposure period. Animals were fed 1 mL of a Tetrafin® food mixture and two full water renewals were conducted daily. Water renewals were conducted using a modified Zumwalt/Brunson water renewal system (USEPA 2000) (Appendix A; Photo A1).

On test day 10, overlying water quality was measured in each replicate beaker and each beaker was terminated by passing the sediment through a 425 µm screen. Surviving organisms were recovered and enumerated. Following enumeration organisms from each replicate were placed on pre-weighed pans and placed in a drying oven for 24 hours at 60 °C. Following the drying period, pans were removed from the oven and dry mass for each replicate was recorded. Pans were then placed in a muffle furnace at 550 °C for 2 hours. After 2 hours, pans were removed from the furnace allowed to cool and ash-free mass was recorded for each replicate.

Water quality parameters

The water quality during bioassay testing was measured using a Thermo Scientific Orion 4Star meter (Thermo Scientific**,** Beverly, MA) for electrical conductivity, a model 315i meter (WTW; Weilheim, Germany) for pH, and a model Oxi 330 meter (WTW; Weilheim, Germany) for DO. Total overlying water ammonia, hardness and alkalinity were measured using LeMotte titration kits (Chestertown, MD, USA). Total pore water ammonia was measured using a 720A ion-selective electrode (ISE) meter (Thermo Orion Electron Corp., Beverly, MA) equipped with a 95-12 ammonia-sensitive electrode (Thermo Orion Electron Corp., Beverly, MA).

Statistical analysis

Data normality (Kolmogorov–Smirnov test), homogeneity (Levene's Test), and sediment differences compared to the control were conducted using SigmaStat software (Version 3.5, SPSS, Chicago, IL). Statistical significance was determined at $\alpha = 0.05$. Survival data were arcsine-square-root transformed prior to analysis. Where data were normal and homogeneous or could be made normal and/or homogeneous through a data transformation a one-way ANOVA was conducted followed by means comparison to the control using the Dunnett's mean comparison method. Where data were not normal and/or homogenous, the Kruskal–Wallis one-way ANOVA on ranks was applied followed by means comparison to the control using the Dunnett's mean comparison procedure. Where sample sizes were unequal the Dunn's mean comparison procedure was utilized. Data endpoints analyzed include survival, ash-free biomass per initial organism, and ash-free dry weight per surviving organism.

RESULTS

Water quality parameters for the *Chironomus dilutus* 10-day bioassay were within the acceptability ranges specified by testing guidance (US EPA 2000) (Appendix B; Table B1). All pore water total ammonia concentrations were below the 20 mg/L guidance for freshwater organisms provided in the Inland Testing Manual (USEPA /USACE 1998) (Appendix B; Table B2).

Survival in the negative control was 88.8% and exceeded the 70% performance requirement indicated in testing guidance (US EPA 2000) (Table 3). The performance criterion of minimum ash-free individual control weight equaling or exceeding 0.48 mg was also met with control individual ash-free dry weight measuring 1.077 mg.

Survival ranged from 13.8% to 95% in the sediment samples tested (Table 3). A significant reduction in survival was detected in sediment sample OC-42. Significant reductions in total biomass per initial organism were detected for sediment samples DC-25 and OC-38 and significant reductions in total biomass per initial organisms and in ash-free dry weight per surviving organism were detected for sediment samples OC-42, OC-44 and OC-46. No significant effects on survival or biomass/weight were detected for the remaining sediment samples evaluated.

Table 2. *Chironomus dilutus* initial individual dry weight. Mean dry weight (± one standard deviation).

Organism	Individual Dry Weight (mg)	Individual Ash-free Dry Weight (mg)
Chironomus dilutus	0.213 ± 0.09	0.239 ± 0.02

Table 3. *Chironomus dilutus* mean survival and mass (± one standard deviation). Asterisks denote a statistically significant reduction in survival or mass relative to the control sediment.

Appendix D. Statistical analyses for Duck and Otter Creeks *Chironomus dilutus* bioassay

Duck and Otter Creek 10-d % Survival

One Way Analysis of Variance Thursday, September 29, 2011, 11:01:57 PM

Data source: Data 1 in Duck and Otter Creek (2011)

Normality Test: Failed (P = <0.001)

Test execution ended by user request, ANOVA on Ranks begun

Kruskal-Wallis One Way Analysis of Variance on Ranks Thursday, September 29, 2011, 11:01:57 PM

Data source: Data 1 in Duck and Otter Creek (2011)

Group	N	Missing	Median	25%	75%
Control	8	0	1.249	1.107	1.410
DC-22	8	0	1.571	1.249	1.571
DC-23	8	0	1.571	1.249	1.571
DC-25	8	0	1.249	1.107	1.410
OC-35	8	0	1.571	1.178	1.571
OC-38	8	0	1.178	1.107	1.410
OC-40	8	0	1.410	1.178	1.571
OC-41	8	0	1.249	1.049	1.571
OC-42	8	0	0.232	0.000	0.522
OC-44	8	0	0.886	0.632	0.939
OC-45	8	0	1.410	1.178	1.571
OC-46	8	0	1.410	1.249	1.571

H = 40.878 with 11 degrees of freedom. (P = <0.001)

The differences in the median values among the treatment groups are greater than would be expected by chance; there is a statistically significant difference (P = <0.001)

To isolate the group or groups that differ from the others use a multiple comparison procedure.

Multiple Comparisons versus Control Group (Dunnett's Method) :

Comparison	Diff of Ranks	q'	P<0.05
OC-42 vs Control	343.000	3.078	Yes
OC-44 vs Control	226.000	2.028	No
DC-23 vs Control	128.000	1.149	Do Not Test
DC-22 vs Control	128.000	1.149	Do Not Test
OC-46 vs Control	117.000	1.050	Do Not Test
OC-35 vs Control	99.000	0.888	Do Not Test

Daily Observations

Project: GLNPO-Duck and Otter Creeks (*Chironomus dilutus*)

Day: 3 (DT) – 4

Date: 9/2/11 **Technician Initials:** DF

Time: AM

Water exchange counter: N/A

Comments: Sediment added to beakers. Overlying water added and beakers placed in chamber to equilibrate.

Day -1 – 2 water exchanges conducted.

Day: 0

Date: 9-6-11 **Technician Initials:** JW/SS

Time: 1000

Water exchange counter: 3 - later changed to 0

Comments: Parameters taken on all beakers, see sheet. Animals added to beakers completion (1200). Counter on 3, thus later reset to 0. Water exchange witnessed by DF. Test fed. DA SS

Daily Observations

Day: 1

Date: 9-7-11 **Technician Initials:** JW/JS

Time: 1039

Water exchange counter: 2

Comments: Observation of beakers, Worms in beakes 44, appear on top of sediment, Moderate temp 24.3°C, Daily water quality parameters taken, tested

Day: 2

Date: 09.09.11 **Technician Initials:** [illegible]

Time: 1000

Water exchange counter: 5

Comments: CHAMBER TEMPERATURE @ 24.1° C, MODULE TEMPS. @ 24.0°C, TEST CHECKED FOR FLOATERS - NONE FOUND SEDS. 42 AND 44 - ORGANISMS STILL NOT BURROWING. DAILY OBSERVATIONS MADE, PARAMETERS - TEMPERATURE AND D.O TAKEN.

Daily Observations

Day: 3

Date: 9-9-11 **Technician Initials:** JS

Time: 0830

Water exchange counter: 9

Comments: Chamber temp 24.0°C, Worms seen in beaker: 42B; 44-B; 44-D, 42-C 42-A; 42-F; 42-D; 42-E. Daily parameters (see separate sheet)

Re: Data Review of Total Organic Carbon Analyses
For Sediment Samples Collected on November 2-4, 2010
Duck and Otter Creeks 2010 Data Gaps Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2F-ALFI

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for sediment samples collected on November 2-4, 2010, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks 2010 Data Gaps Investigation (Duck and Otter) Site. This data review is for total organic carbon (TOC) analysis of 70 sediment samples that includes 6 field splits and 6 field duplicates that were collected by the WESTON Superfund Technical Assessment and Response Team (START). The samples were validated in accordance with the "Quality Assurance Project Plan, Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, which includes using the U.S. EPA Contract Laboratory Program National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed by Columbia Analytical Services (CAS) located in Kelso, Washington, under the following six work orders:

- K1012377
- K1012381
- K1012413
- K1012416
- K1012421
- K1012529

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

The samples were analyzed for TOC using U.S. EPA SW-846 Method 9060. CAS provided WESTON with a staged electronic data deliverable (SEDD) that was used in conjunction with the Automated Data Review (ADR) software to assist in reviewing the data. All SEDDs were imported into the ADR software for review by the software program and all data was checked for completeness. Five percent of the data was put through a full data validation. Therefore, one of the work orders, K1012377, was selected for the full data validation. Work order K1012377 contained 12 sediment samples, including 6 field splits, for TOC analysis.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for work order K1012377. Attachment B to this report contains a printed report from ADR that provides a summary of results with qualifiers applied by the laboratory and the ADR program. Attachment C contains the data qualifier definitions. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF TOC DATA REVIEW

As stated above, five percent of the data was fully validated. Work order K1012377 was selected for full data validation. In work order K1012377, the holding times, method blanks, calibration standards, calibration blanks, laboratory duplicates, matrix spike (MS), matrix spike duplicate (MSD), and laboratory control samples (LCS) were all within the QC limits. All sample results were based on a dry weight for the TOC analyses.

The QAPP stated that field splits (replicates) and field duplicate samples would be collected at a 10 percent frequency. There were a total of 58 field investigative samples and 6 field duplicates and 6 field splits collected. Therefore, the QAPP-stated frequency was met for the field duplicates and splits. A QC limit for field splits and field duplicates was not stated in the QAPP; therefore, a default QC limit of 50 relative percent difference (RPD) was used to evaluate field split and duplicate results. The RPDs for field split and field duplicate samples were below 50 percent except for one field duplicate which slightly exceeded this limit with an RPD of 52 percent. This one slight exceedance does not affect data usability. Field duplicate and field split results are acceptable. Tables 2 and 3 summarize the field split and field duplicate results, respectively.

Below is a discussion of the data quality indicators.

DATA QUALITY INDICATORS REVIEW

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The laboratory reporting limit of 0.1 percent TOC as stated in the QAPP was met for all samples. Sensitivity was acceptable.

Precision. Field precision is typically determined by evaluating the RPDs for the field split and field duplicate results. The mean RPD for field splits is 17.0 and for field duplicates is 20.2. The mean field split and duplicate RPDs indicate acceptable field precision. Table 4 summarizes the field precision results.

Laboratory precision was determined by evaluating the RPD values for MS/MSD samples and laboratory duplicates. The mean RPD for the laboratory duplicates is 3.6 and the mean RPD for MS/MSDs is 6.1. The RPDs are within the QAPP stated limits for precision. Table 4 summarizes the laboratory precision results. The laboratory precision is acceptable for the TOC analyses.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for percent recovery for MS/MSD and LCS results. Table 4 summarizes the accuracy estimates for the TOC analyses. The mean percent recovery for the MS/MSD samples is 103.7 percent and for the LCS samples is 85 percent. All mean percent recoveries are within the QAPP specified QC limits. Laboratory accuracy was acceptable.

The mean MS/MSD and LCS recoveries do not indicate a bias (either high or low) for the TOC analyses.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, all QC indicator samples that were analyzed were mostly within control limits and no data qualifiers were applied.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 312-424-3300.

Very truly yours,
Weston Solutions, Inc.

QA/QC ANALYSIS CHECKLIST FOR TOC FOR WORK ORDER K1012377

TOC BY SW-846 METHOD 9060

WORK ORDER # K1012377

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: GLNPO Duck and Otter Creeks 2010 Data Gaps Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: January 19, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals ____	PCBs _____	pH _____	TOC __X__
Dioxins/Furans _____	PAHs _____	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other _____

2. Were the target detection limits met for each parameter?

Yes X
No _____ (EXPLAIN)

The TOC analysis met the reporting limit stated in the QAPP of 0.05 percent (%).

3. Were the method blanks less than the established MDL for each parameter?

Yes X
No _____ (EXPLAIN)

The method blank did not contain TOC detections above the reporting limit.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes X
No _____ (EXPLAIN)

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Surrogates and internal standards do not apply to the TOC analysis.

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

An LCS was analyzed with the TOC analysis and the recovery was within the QAPP-specified QC limit.

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

The QAPP did not specify QC limits for the CCV recoveries and method 9060 does not present a QC limit for CCV recoveries. The CCV recoveries were mostly within a QC limit of 90 to 110 percent recovery. A couple of the CCV recoveries were slightly above the 110 percent limit at 111 and 113 percent. No qualification was applied for this minor discrepancy.

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes	X	
No		

The calibration blanks did not contain detections of TOC.

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

ICSs are not applicable to TOC analysis.

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Serial dilutions are not applicable to TOC analysis.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

Trip blanks and storage blanks are not applicable to this method.

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

The analyses were performed in the holding time limit of 28 days from collection to analysis.

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	X	
No		(EXPLAIN)

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

Dry weight concentrations were reported.

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “UNACCEPTABLE” marked above are described immediately following the “UNACCEPTABLE” marking in the corresponding item above.

The data are acceptable for use.

Re: Data Review of Semivolatile Organic Compounds (SVOC) Analysis
For Sediment Samples Collected on October 15, 2010
CLP Case No. 40638, SDG No. E01T8
Duck and Otter Creeks 2010 Data Gaps Investigation
Wood and Lucas Counties, Ohio
DCN: 1030-2F-ALGI

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for the five percent of the sediment samples collected in October 2010 for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks 2010 Data Gaps Investigation Site. This data review is for SVOC analyses of five sediment samples that include one field duplicate sample that were collected by WESTON and analyzed under Sample Delivery Group (SDG) number E01T8. The samples were validated in accordance with the "Quality Assurance Project Plan, Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, which includes using the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed under the U.S. EPA CLP by ALS Laboratory Group (ALS) located in Salt Lake City, Utah, under case number 40638. Because only five percent of data is to be validated, SDG number E01T8 was selected for data validation.

Sediment samples were analyzed for SVOCs using U.S. EPA CLP Statement of Work (SOW) SOM01.2 which utilizes gas chromatography/mass spectrometry (GC/MS). Table 2 provides a list of the SVOCs that were analyzed. ALS did not provide a Staged Electronic Data Deliverable

(SEDD) with the CLP analytical package. Therefore, the Automated Data Review (ADR) software was not utilized to assist in reviewing this data.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for SDG E01T8. Attachment B to this report contains a printed summary report of sample results with hand-written qualifiers that were applied during the data review. Attachment C to this report contains a list of the data qualifiers associated with the sample results. The QC limits utilized were those stated in the Quality Assurance Project Plan (QAPP). If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF SVOC DATA REVIEW

The holding times, continuing calibration, method blank, surrogates, internal standards, instrument check, matrix spike (MS), and matrix spike duplicate (MSD) were within the QC limits.

The relative percent differences (RPD) calculated for the field duplicate pairs were high. In addition, there was one minor problem with the initial calibration which did not require sample qualification. These issues are discussed in further detail below under Minor Problems.

Below is a review of the minor problems associated with QC failures and a summary of the data quality indicators associated with the SVOC analysis for the sediment samples collected on October 15, 2010.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

Initial Calibration Results. In the initial calibration, pentachlorophenol had a relative standard deviation (RSD) of 30.3 which is above the QC limit of 20 RSD. Because pentachlorophenol was not detected in the samples, no qualifications were required.

Field Duplicate Results. The field duplicates are collected adjacent to an investigative sample and are not of the same homogenized material. One field duplicate pair is associated with the sediment samples collected on October 15, 2010, and SDG E01T8 (see Table 1 for which samples were designated as field duplicates).

Because a QC limit for field duplicates was not stated in the QAPP, a default QC limit of 50 RPD was used to evaluate field duplicate results. The duplicate results were mostly non-detect

and RPDs could not be calculated. For the detected results, two of the RPD values were low but the majority of the RPD values were very high. These very elevated RPDs are most likely due to sample heterogeneity associated with SVOCs in the sediment samples. Table 3 summarizes the field duplicate results and RPDs.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The QAPP stated that method SOM01.2 would achieve a reporting limit of 170 to 330 micrograms per kilogram (µg/kg), dependent on the SVOC compound analyzed. The laboratory achieved the QAPP-stated reporting limits, when adjusted for dilution factor and percent moisture. Sensitivity was adequate for the SVOC analyses of sediment samples collected on October 15, 2010, that are associated with SDG E01T8.

Precision. Field precision is determined by evaluating the RPDs for the field duplicate results. The RPD values for the field duplicates were mostly high. The field duplicate results indicate sample heterogeneity associated with SVOCs in the sediment samples.

Laboratory precision was evaluated by reviewing the RPD values between the MS and MSD results. There was one MS/MSD pair associated with this SDG. The RPDs were within the QAPP-stated QC limits and ranged from 1 to 30 percent. Laboratory precision was acceptable for the SVOC analysis. Table 4 summarizes the laboratory precision results.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for MS/MSD results. The MS/MSD percent recoveries were within the QAPP QC limits. Table 4 summarizes the accuracy estimates for the SVOC analysis. The mean MS/MSD percent recoveries ranged from 54 to 70 percent. Laboratory accuracy was acceptable. The MS/MSD recoveries indicate a low bias associated with the SVOC analyses.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, the data are usable for comparison to the SVOC screening criteria stated in the QAPP. No qualifications were added to the samples during the data review. Definitions for the laboratory qualifications are included in Attachment C.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 847-918-4000.

Very truly yours,

Weston Solutions, Inc.

CHECKLIST FOR SVOC ANALYTICAL DATA FOR CASE # 40638, SDG # E01T8

SVOCs
BY CLP SOW SOM01.2

CASE# 40638
SDG# E01T8

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: Duck and Otter Sediment Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: March 17, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals ___	PCBs _____	pH _____	TOC _____
Dioxins/Furans _____	SVOCs __X___	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other _____

2. Were the target detection limits met for each parameter?

Yes	X
No	

When adjusted for dilution factor and percent moisture, the QAPP-stated reporting limits were met for SVOC compounds.

3. Were the method blanks less than the established MDL for each parameter?

Yes	X	
No		(EXPLAIN)

The method blank contained no detections of target analytes.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

There are no field replicates associated with this SDG.

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes		
No	X	(EXPLAIN)

There is one field duplicate associated with this SDG (identified with a "DP" suffix in the station location designation). The field duplicate were collected adjacent to the associated investigative sample. The field duplicate results and investigative sample results were compared to a standard QC limit of 50 RPD or less. For the detected compounds, most of the RPDs were above the 50 percent QC limit and there was a significant difference between the field duplicate and parent sample in most cases. These elevated RPDs indicate significant sample heterogeneity associated with SVOCs in the sediment samples associated with this site.

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

LCSs are not analyzed with SVOC analysis by SOM01.2.

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

There were no QC limits specified in the QAPP; therefore, the QC limits specified in the CLP SOW were used for the initial calibration and continuing calibration verification (CCV) checks. For the initial calibration, pentachlorophenol exceeded the QC limit of 20 RSD. Because pentachlorophenol was not detected in the samples, no qualification was required.

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Serial dilution is not applicable to SW-846 Method 8270C.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

Trip blanks and storage blanks are not applicable to SW-846 Method 8270C.

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

Samples were analyzed within the holding time requirement of 14 days to extraction from sample collection and 40 days to analysis following extraction.

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Laboratory duplicates were not analyzed with the samples.

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

Dry-weight concentrations are reported.

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “UNACCEPTABLE” marked above are described immediately following the “UNACCEPTABLE” marking in the corresponding item above.

In addition, some results were detected below the laboratory reporting limit and were flagged “J” as estimated for this discrepancy. The data are acceptable for use as qualified.

DATA QUALIFIER DEFINITIONS

LABORATORY DATA QUALIFIER DEFITIONS

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the quantitation limit).

N – This flag indicates presumptive evidence of a compound and is only used for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search. This flag is used in combination with the J flag.

U - The analyte was not detected above the reporting limit. The reported result is the laboratory reporting limit.

Re: Data Review of Dissolved Metals Analysis
For the Pore Water of Sediment Samples Collected on November 2-4, 2010
Duck and Otter Creeks 2010 Data Gaps Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2F-ALFI

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for sediment samples collected on November 2-4, 2010, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks 2010 Data Gaps Investigation (Duck and Otter) Site. This data review is for dissolved metals analysis of the pore water of 14 sediment samples including one field split sample that were collected by the WESTON Superfund Technical Assessment and Response Team (START). The samples were validated in accordance with the "Quality Assurance Project Plan, Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, which includes using the U.S. EPA Contract Laboratory Program National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed by Columbia Analytical Services (CAS) located in Kelso, Washington, under the following six work orders:

- K1012377
- K1012381
- K1012413
- K1012416
- K1012421
- K1012529

Pore water was extracted from the sediment samples and then the pore water was analyzed for dissolved mercury using SW-846 Method 7470A and for all other dissolved metals using SW-846 Methods 6010B and 6020. Table 2 provides a list of the dissolved metals analytes. CAS provided WESTON with a staged electronic data deliverable (SEDD) that was used in conjunction with the Automated Data Review (ADR) software to assist in reviewing the data. All SEDDs were imported into the ADR software for review by the software program and all

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

data was checked for completeness. Five percent of the data was put through a full data validation. Therefore, one of the work orders, K1012377, was selected for the full data validation. Work order K1012377 contained two sediment samples including one field split sample for the dissolved metals analysis of pore water.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for work order K1012377. Attachment B to this report contains a printed report from ADR that provides a summary of results with qualifiers applied by the laboratory and the ADR program. Attachment C contains the data qualifier definitions. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF METALS DATA REVIEW

As stated above, five percent of the data was fully validated. Work order K1012377 was selected for full data validation. In work order K1012377, the holding times, calibration standards, interference check sample, laboratory control sample (LCS), and laboratory control sample duplicate (LCSD) were all within the QC limits.

In work order K1012377, the calibration blank had some metals detected above the method detection limit but below the reporting limit. The sample result for thallium in DC-19 was also below the reporting limit and at a similar concentration as the calibration blank. This result was flagged as not detected. In addition, the serial dilution result for manganese was outside QC limits and required manganese results to be flagged as estimated in this work order.

In accordance with the Field Sampling Plan, field duplicates and field splits were not to be collected for the pore water analyses. However, one field split sample was collected. This split had slightly elevated relative percent difference (RPD) values for lead and zinc. This is discussed below under Minor Problems.

Through full data validation and the ADR program, some minor problems with other quality control indicators were discovered. Specifically, the method blanks contained some minor detections of target analytes which caused a couple of mercury results to be flagged as not detected.

Below are a description of the minor problems with QC failures and a review of the data quality indicators.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Method Blanks. The method blanks contained minor detections of some analytes at concentrations below the reporting limit but above the method detection limit. The detected sample results for most of these metals were above the reporting limit and significantly above the method blank concentration and did not require qualification.

The exceptions are mercury in samples OC-27 and OC-32. These mercury results were flagged "U" as not detected due to method blank contamination.

Calibration Blanks. Calibration blanks were assessed in work order K1012377, the work order selected for full data validation (the ADR program does not assess calibration blank data). Some metals were detected in the calibration blanks below the reporting limit. In work order K1012377, the detected result for thallium in sample DC-19 was below the reporting limit and near the calibration blank result. This result for thallium was flagged "U" as not detected, as required, based on calibration blank results. These qualifiers were manually added in the ADR program and can be seen in the "Overall Qualifier" column of the ADR summary report in Attachment B.

Serial Dilution Results. Serial dilutions were assessed in work order K1012377, the work order selected for full data validation (the ADR program does not assess serial dilution results). In work order K1012377, manganese was detected in samples at greater than 50 times the detection limit and had a greater than 10 percent difference in the serial dilution. Therefore, manganese results were flagged "J" as estimated based on serial dilution results for work order K1012377. Data usability is not affected.

Field Split Results. Sample DC-19FS is a field split of sample DC-19. A QC limit for field splits was not stated in the QAPP; therefore, a default QC limit of 50 RPD was used to evaluate field split results. The RPDs are below 50 except for lead and zinc which have and RPDs of 53 and 86 percent, respectively. This likely indicates some heterogeneity associated with lead and zinc in this sample and does not affect data usability. Table 3 summarizes the field split results.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the attachments.

Sensitivity. The laboratory reporting limits stated in the QAPP were met for all target metals. The laboratory reported those results detected below the reporting limit and flagged these results with a "J" as estimated. Sensitivity was acceptable for the samples associated with the work orders included in this data review for dissolved metals.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Precision. Field precision was evaluated by evaluating the RPDs for the one field split sample. For the field split, the RPDs ranged from 0 to 86 percent. Although the RPD values for lead and zinc slightly exceeded the QC limits, this does not affect data usability and in general the field split results had excellent correlation to the parent sample results. Field precision was evaluated and found to be acceptable. Table 3 summarizes the field precision results.

Laboratory precision was determined by evaluating the RPD values for the LCS and LCSD pair associated with these work orders. The RPDs for LCS/LCSD were within the QAPP-stated QC limit for all metals. The RPDs ranged from 0 to 3 percent. Laboratory precision was adequate for the dissolved metals analysis. Table 4 summarizes the laboratory precision RPDs.

Accuracy. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for percent recovery for the LCS/LCSD results. The mean LCS recoveries were within the QAPP-stated QC limits and ranged from 97 to 108 percent. Table 4 summarizes the accuracy estimates for this project. Laboratory accuracy was acceptable.

Based on the mean LCS/LCSD recoveries, there does not appear to be a bias associated with the dissolved metals analyses.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All sample results were received.

In summary, the data are acceptable for use and a few data qualifications were applied to the sample results for method blank contamination, calibration blank contamination, and serial dilutions. The ADR Summary Report in Attachment B indicates which sample results were flagged during data validation. The laboratory data qualifiers applied are also indicated on the ADR Summary Report in Attachment B. Attachment C provides data qualifier definitions for those qualifiers applied during data validation and by the laboratory.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 312-424-3300.

Very truly yours,
Weston Solutions, Inc.

QA/QC ANALYSIS CHECKLIST FOR DISSOLVED METALS FOR WORK ORDER K1012377

DISSOLVED METALS IN PORE WATER

BY SW-846 METHODS 6010B, 6020, AND 7470A

WORK ORDER # K1012377

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: Duck and Otter Creeks 2010 Data Gaps Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: February 16, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals (Dissolved Metals) _X___		PCBs _____	pH _____	TOC _____
Dioxins/Furans _____	PAHs _____	Pesticides _____	DO _____	
AVS _____	SEM Metals _____	Particle Size _____	Other _____	

2. Were the target detection limits met for each parameter?

Yes	X	
No		(EXPLAIN)

3. Were the method blanks less than the established MDL for each parameter?

Yes		
No	X	(EXPLAIN)

The method blank contained minor detections of aluminum, calcium, cobalt, copper, magnesium, manganese, and mercury at concentrations below the reporting limit. The detected sample results for these metals were above the reporting limit and significantly above the method blank concentration and did not require qualification.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes		
No	X	(EXPLAIN)

There is one field replicate (split) associated with this work order (identified with an "FS" suffix in the station location designation). The field replicate results and investigative sample results were compared to a standard QC limit of 50 RPD or less.

For the field split pair, DC-19 and DC-19FS, this limit was exceeded for lead and zinc. The RPDs for lead and zinc were 53 and 86 percent, respectively. This shows some minor heterogeneity regarding lead and zinc in this sample matrix.

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Field duplicate analyses are not applicable to this work order.

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		

MS/MSDs were not analyzed with the dissolved metals analysis.

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

An MSD was not analyzed with the dissolved metals analysis.

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

The LCS recoveries were within QC limits.

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

There were detections of some target analytes in the calibration blanks that were below the reporting limit but above the method detection limit. The detected result for thallium in sample DC-19 was below the reporting limit and near the calibration blank result. The result for thallium in sample DC-19 was flagged "U" as not detected based on calibration blank results.

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

Manganese was detected in samples at greater than 50 times the reporting limit and had a greater than 10 percent difference in the serial dilution. Therefore, manganese results were flagged "J" as estimated based on serial dilution results. Data usability is not affected.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

Trip blanks and storage blanks are not applicable to this work order.

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Dissolved Metals Checklist
Duck and Otter Creeks 2010 Data Gaps Investigation
Columbia Analytical Services
Laboratory Work Order #: K1012377

17. Are measured dry-weight contaminant concentrations reported?

Yes	Not Applicable	
No	_____	(EXPLAIN)

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “UNACCEPTABLE” marked above are described immediately following the “UNACCEPTABLE” marking in the corresponding item above.

The data are acceptable for use as qualified.

ATTACHMENT C

DATA QUALIFIER DEFINITIONS

LABORATORY DATA QUALIFIER DEFITIONS

J - The result is an estimated value that was detected outside the quantitation range.

U - The analyte was analyzed for, but not detected at or above the reporting limit.

DATA VALIDATION DATA QUALIFIER DEFITIONS

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the quantitation limit).

U - The analyte was analyzed for, but not detected above the level of the reported sample quantitation limit.

ATTACHMENT C

DATA QUALIFIER DEFINITIONS

LABORATORY DATA QUALIFIER DEFITIONS

J - Estimated Result. The result is less than the laboratory reporting limit.

U - The analyte was not detected above the reporting limit. The reported result is the laboratory reporting limit.

DATA VALIDATION DATA QUALIFIER DEFITIONS

J - The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

U - The analyte was not detected above the reporting limit or was detected in the blank at a concentration requiring qualification of sample result as not detected. The reported result is the laboratory reporting limit.

Re: Data Review of Polychlorinated Biphenyls (PCB) Analysis
For Sediment Samples Collected on November 3, 2010
CLP Case No. 40749, SDG No. E0226
Duck and Otter Creeks 2010 Data Gaps Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2F-ALFI

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for the five percent of the sediment samples collected on November 2-4, 2010, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks 2010 Data Gaps Investigation Site. This data review is for PCB analyses of nine sediment samples that include three field duplicate samples that were collected by WESTON under Sample Delivery Group (SDG) number E0226. The samples were validated in accordance with the "Quality Assurance Project Plan, Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, which includes using the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed under the U.S. EPA CLP by ALS Laboratory Group (ALS) located in Salt Lake City, Utah, under case number 40749. There were four SDGs associated with this case number for PCB analyses. Because only five percent of data is to be validated, SDG number E0226 was selected for data validation.

Sediment samples were analyzed for PCBs using U.S. EPA CLP Statement of Work (SOW) SOM01.2. Table 2 provides a list of the PCBs that were analyzed. ALS did not provide a Staged Electronic Data Deliverable (SEDD) with the CLP analytical package. Therefore, the Automated Data Review (ADR) software was not utilized to assist in reviewing this data.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for SDG E0226. Attachment B to this report contains a printed summary report of sample results with hand-written qualifiers that were applied during the data review. Attachment C to this report contains a list of the data qualifiers associated with the sample results. The QC limits utilized were those stated in the Quality Assurance Project Plan (QAPP). If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF PCB DATA REVIEW

The holding times, initial calibration, continuing calibration, method blank, surrogates, matrix spike (MS), matrix spike duplicate (MSD), and laboratory control sample (LCS) were within the QC limits.

The relative percent difference (RPD) calculated for one of the field duplicate pairs was somewhat high. This is discussed in further detail below under Minor Problems.

Below is a review of the minor problems associated with QC failures and a summary of the data quality indicators associated with the PCB analysis for the sediment samples collected on November 3, 2010.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

Field Duplicate Results. The field duplicates were collected adjacent to an investigative sample and are not of the same homogenized material. Three field duplicate pairs are associated with the sediment samples collected on November 3, 2010, and SDG E0226 (see Table 1 for which samples were designated as field duplicates).

Because a QC limit for field duplicates was not stated in the QAPP, a default QC limit of 50 RPD was used to evaluate field duplicate results. The duplicate results were non-detect except for Aroclor 1254 in two of the field duplicate pairs. For one of the field duplicate pairs with a detection of Aroclor 1254, the RPD was below 50. For field duplicate pair E0231 and E0233, the RPD for Aroclor 1254 was 99 percent which is greater than 50 RPD. This very elevated RPD is most likely due to sample heterogeneity associated with PCBs. Table 3 summarizes the field duplicate results and RPDs.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Sensitivity. The QAPP stated that modified method SOM01.2 would achieve a reporting limit of 33micrograms per kilogram (µg/kg) for all Aroclor compounds. The laboratory achieved reporting limits that ranged from 38 to 57 µg/kg. These increases over the QAPP-stated reporting limit are mostly due to adjustments for percent moisture in the samples and do not affect data usability as the reporting limits are below human health and ecological reference limits stated in the QAPP. Sensitivity was adequate for the PCB analyses of sediment samples collected on November 3, 2010, that are associated with SDG E0226.

Precision. Field precision is determined by evaluating the RPDs for the field duplicate results. The RPD for the one field duplicate was 99 percent while the other was 41 percent. The field duplicate result with a 99 RPD value indicates sample heterogeneity with PCBs.

Laboratory precision was evaluated by reviewing the RPD values between the MS and MSD results. There was only one MS/MSD pair associated with this SDG for which RPDs could be evaluated. The RPDs for the Aroclor 1016 and 1260 (the PCBs spiked in the MS/MSD) were 15 and 13 percent, respectively. These RPDs are within the QAPP-stated QC limits. Laboratory precision was acceptable for the PCB analysis. Table 4 summarizes the laboratory precision results.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for percent recovery for LCS and MS/MSD results. The LCS and MS/MSD percent recoveries were within the QAPP QC limits. Table 4 summarizes the accuracy estimates for the PCB analysis. The percent recoveries for the LCS are 61 and 81percent for Aroclor 1016 and Aroclor 1260, respectively. The mean MS/MSD percent recoveries are 85 and 85 percent for Aroclor 1016 and Aroclor 1260, respectively. Laboratory accuracy was acceptable. The Aroclor recoveries indicate a low bias associated with the PCB analysis.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, the data are usable for comparison to the PCB screening criteria stated in the QAPP. No qualifications were added to the samples during the data review. Definitions for the laboratory qualifications are included in Attachment C.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 847-918-4000.

CASE# 40749
SDG# E0226

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: Duck and Otter Sediment Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: March 2, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals ___	PCBs __X___	pH _____	TOC _____
Dioxins/Furans _____	PAHs _____	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other _____

2. Were the target detection limits met for each parameter?

Yes	
No	X

The QAPP stated that modified method SOM01.2 would achieve a reporting limit of 33 micrograms per kilogram (µg/kg) for all Aroclor compounds. The laboratory achieved reporting limits that ranged from 38 to 57 µg/kg. These increases over the QAPP-stated reporting limit are mostly due to adjustments for percent moisture in the samples and do not affect data usability as the reporting limits are below human health and ecological reference limits stated in the QAPP.

3. Were the method blanks less than the established MDL for each parameter?

Yes	X	
No		(EXPLAIN)

The method blank contained no detections of target analytes.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

There are no field replicates associated with this SDG.

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes		
No	X	(EXPLAIN)

There are three field duplicates associated with this SDG (identified with a "DP" suffix in the station location designation). The field duplicates were collected adjacent to the associated investigative sample. The field duplicate results and investigative sample results were compared to a standard QC limit of 50 RPD or less. The duplicate results were non-detect except for Aroclor 1254 in two of the field duplicate pairs. For field duplicate pair E0231 and E0233, the RPD for Aroclor 1254 was 99 percent which is greater than 50 RPD. This very elevated RPD is most likely due to sample heterogeneity associated with PCBs.

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

The LCS recoveries met the QC limits specified in the QAPP.

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

There were no QC limits specified in the QAPP; therefore, the QC limits specified in the CLP SOW were used for the initial calibration and continuing calibration verification (CCV) checks. The initial calibration and CCVs were within the method QC limits for detected compounds. Note that in one instance, Aroclor 1248 was detected outside the QC limit of less than or equal to 15 percent difference; however, Aroclor 1248 was not detected in the samples and therefore, no qualification was applied.

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes
No
Not Applicable
(EXPLAIN)

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes
No
Not Applicable
(EXPLAIN)

Interference check samples are not applicable to SW-846 Method 8270C.

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes
No
Not Applicable
(EXPLAIN)

Serial dilution is not applicable to SW-846 Method 8270C.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes
No
Not Applicable
(EXPLAIN)

Trip blanks and storage blanks are not applicable to SW-846 Method 8270C.

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

Samples were analyzed within the holding time requirement of 14 days to extraction from sample collection and 40 days to analysis following extraction.

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Laboratory duplicates were not analyzed with the samples.

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

Dry-weight concentrations are reported.

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “UNACCEPTABLE” marked above are described immediately following the “UNACCEPTABLE” marking in the corresponding item above.

In addition, some results were detected below the laboratory reporting limit and were flagged “J” as estimated for this discrepancy. The data are acceptable for use as qualified.

DATA QUALIFIER DEFINITIONS

LABORATORY DATA QUALIFIER DEFITIONS

P - There is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported.

U - The analyte was not detected above the reporting limit. The reported result is the laboratory reporting limit.

Re: Data Review of Polychlorinated Biphenyls (PCB) Analysis
For Sediment Samples Collected on October 15, 2010
CLP Case No. 40638, SDG No. E01T8
Duck and Otter Creeks 2010 Data Gaps Investigation
Wood and Lucas Counties, Ohio
DCN: 1030-2F-ALGI

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for the five percent of the sediment samples collected in October 2010 for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks 2010 Data Gaps Investigation Site. This data review is for PCB analyses of five sediment samples that include one field duplicate sample that were collected by WESTON and analyzed under Sample Delivery Group (SDG) number E01T8. The samples were validated in accordance with the "Quality Assurance Project Plan, Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, which includes using the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed under the U.S. EPA CLP by ALS Laboratory Group (ALS) located in Salt Lake City, Utah, under case number 40638. Because only five percent of data is to be validated, SDG number E01T8 was selected for data validation.

Sediment samples were analyzed for PCBs using U.S. EPA CLP Statement of Work (SOW) SOM01.2. Table 2 provides a list of the PCBs that were analyzed. ALS did not provide a Staged Electronic Data Deliverable (SEDD) with the CLP analytical package. Therefore, the Automated Data Review (ADR) software was not utilized to assist in reviewing this data.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for SDG E01T8. Attachment B to this report contains a printed summary report of sample results with hand-written qualifiers that were applied during the data review. Attachment C to this report contains a list of the data qualifiers associated with the sample results. The QC limits utilized were those stated in the Quality

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Assurance Project Plan (QAPP). If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF PCB DATA REVIEW

The holding times, initial calibration, continuing calibration, method blank, surrogates, matrix spike (MS), matrix spike duplicate (MSD), laboratory control sample (LCS), and field duplicate samples were within the QC limits.

Below is a summary of the data quality indicators associated with the PCB analysis for the sediment samples collected on October 15, 2010.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The QAPP stated that modified method SOM01.2 would achieve a reporting limit of 33micrograms per kilogram (µg/kg) for all Aroclor compounds. The laboratory achieved these reporting limits, when adjusted for percent moisture. Sensitivity was adequate for the PCB analyses of sediment samples collected on October 15, 2010, that are associated with SDG E01T8.

Precision. Field precision is determined by evaluating the RPDs for the field duplicate results. The field duplicate results and investigative sample results were both non-detect for PCB compounds indicating good correlation. Field precision was acceptable. Table 3 summarizes the field duplicate results.

Laboratory precision was evaluated by reviewing the RPD values between the MS and MSD results. There was only one MS/MSD pair associated with this SDG for which RPDs could be evaluated. The RPDs for the Aroclor 1016 and 1260 (the PCBs spiked in the MS/MSD) were 1 and 5 percent, respectively. These RPDs are within the QAPP-stated QC limits. Laboratory precision was acceptable for the PCB analysis. Table 4 summarizes the laboratory precision results.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for percent recovery for LCS and MS/MSD results. The LCS and MS/MSD percent recoveries were within the QAPP QC limits. Table 4 summarizes the accuracy estimates for the PCB analysis. The percent recoveries for the LCS are 115 and 113percent for Aroclor 1016 and Aroclor 1260, respectively. The mean MS/MSD percent recoveries are 92 and 110 percent for Aroclor 1016

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

and Aroclor 1260, respectively. Laboratory accuracy was acceptable. The Aroclor recoveries in the LCS indicate a slightly high bias associated with the PCB analysis.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, the data are usable for comparison to the PCB screening criteria stated in the QAPP. No qualifications were added to the samples during the data review. Attachment B contains the data summary sheets. Definitions for the laboratory qualifications are included in Attachment C.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 847-918-4000.

Very truly yours,
Weston Solutions, Inc.

PCBs
BY CLP SOW SOM01.2

CASE# 40638
SDG# E01T8

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: Duck and Otter Sediment Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: March 18, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals ___	PCBs __X___	pH _____	TOC _____
Dioxins/Furans _____	PAHs _____	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other _____

2. Were the target detection limits met for each parameter?

Yes	X
No	

The QAPP stated that modified method SOM01.2 would achieve a reporting limit of 33 micrograms per kilogram (µg/kg) for all Aroclor compounds. When adjusted for percent moisture, the laboratory achieved these reporting limits.

3. Were the method blanks less than the established MDL for each parameter?

Yes	X	
No		(EXPLAIN)

The method blank contained no detections of target analytes.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

There are no field replicates associated with this SDG.

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes	X	
No		(EXPLAIN)

There is one field duplicate associated with this SDG (identified with a "DP" suffix in the station location designation). The field duplicate was collected adjacent to the associated investigative sample. The field duplicate results and investigative sample results were both non-detect for PCB compounds indicating good correlation.

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

For the quantification column, all surrogate recoveries were within QC limits.

One of the surrogates in two of the samples, for the confirmation column only, had a high percent recovery. Because this was the confirmation column and because PCBs were not detected in the samples, no qualification was required.

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

The MS/MSD analyzed on the quantification column was within QC limits.

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

The LCS recoveries met the QC limits specified in the QAPP.

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

There were no QC limits specified in the QAPP; therefore, the QC limits specified in the CLP SOW were used for the initial calibration and continuing calibration verification (CCV) checks. The initial calibration and CCVs were within the method QC limits for detected compounds.

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Interference check samples are not applicable to SW-846 Method 8270C.

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Serial dilution is not applicable to SW-846 Method 8270C.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

Trip blanks and storage blanks are not applicable to SW-846 Method 8270C.

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

Samples were analyzed within the holding time requirement of 14 days to extraction from sample collection and 40 days to analysis following extraction.

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Laboratory duplicates were not analyzed with the samples.

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

Dry-weight concentrations are reported.

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “UNACCEPTABLE” marked above are described immediately following the “UNACCEPTABLE” marking in the corresponding item above.

In addition, some results were detected below the laboratory reporting limit and were flagged “J” as estimated for this discrepancy. The data are acceptable for use as qualified.

Re: Data Review of Polycyclic Aromatic Hydrocarbons (PAH) Analysis
For the Pore Water of Sediment Samples Collected from October 7 to November 4, 2010
Duck and Otter Creeks 2010 Data Gaps Investigation
Wood and Lucas Counties, Ohio
DCN: 1030-2F-ALGI

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for the pore water of sediment samples collected from October 7 to November 4, 2010, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks 2010 Data Gaps Investigation Site. This data review is for PAH analysis of pore water of 28 sediment samples including one field split that were collected by the WESTON Superfund Technical Assessment and Response Team (START). The samples were validated in accordance with the "Quality Assurance Project Plan, Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, which includes using the U.S. EPA Contract Laboratory Program National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed by Energy and Environmental Research Center (EERC) of the University of North Dakota located in Grand Forks, North Dakota. Table 2 provides a list of the PAH analytes that were tested for.

The samples were analyzed for PAHs using methodology developed by Hawthorne et al., 2005, and ASTM D7363. EERC did not provide WESTON with a staged electronic data deliverable (SEDD) and therefore, the Automated Data Review (ADR) software was not used to assist in reviewing the data. Standard quality control (QC) samples are not applicable to the methodology used for the PAHs including laboratory control samples, matrix spike samples, and laboratory duplicates. Therefore, a Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis was not utilized for data review. Attachment A to this report contains a summary report of results with qualifiers applied by the laboratory. Attachment B contains the data qualifier definitions. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

SUMMARY OF PAH DATA REVIEW

The blanks water samples were all non-detect for target analytes.

The Field Sampling Plan indicated that field duplicates and field splits were not required for the PAH analyses of the pore water samples. However, one field split sample was collected for this analysis. There was only one PAH compound detected in both samples and the relative percent difference (RPD) between the two results was 7 percent which is acceptable. There were two PAH compounds detected below the reporting limit in the parent sample that were not detected in the field split. This difference of results does not affect data usability because the results in the one sample were below the reporting limit and are considered estimated.

All sample results were analyzed in duplicate in accordance with the ASTM method. It is up to the data user to decide which result to use or whether to use an average of the results. In addition, the results were reported in nanogram per gram which for water samples is the same a s microgram per liter because the density of water is 1 milligram per liter.

Below is a review of the data quality indicators.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The laboratory reporting limits as stated in the QAPP were not met for all PAH compounds. These reporting limits only slightly exceeded the QAPP-stated reporting limit and were below the applicable screening level stated in the QAPP for ambient water quality criteria. Therefore, data usability is not affected. The laboratory flagged some results with a "J" to indicate that the result was detected below the reporting limit and should be considered estimated. Sensitivity was adequate for the PAH analyses of the pore water of sediment samples collected from October 7 to November 4, 2010.

Precision. Precision is a measure of the agreement between multiple measurements of the same property carried out under similar conditions. Field precision is evaluated by reviewing the RPD results for field duplicates and splits. The one field split collected with these results indicates acceptable field precision.

Laboratory precision is typically determined by evaluating the RPD values for laboratory duplicates. Laboratory duplicates were not analyzed with the PAH analyses. However, EERC did analyze each sample in duplicate in accordance with the ASTM method. Although an RPD

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

value was not calculated for each detected result, a review of the data indicates excellent correlation between the sample result duplicates. Laboratory precision is acceptable.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was not evaluated because QC samples typically analyzed to assess accuracy are not applicable to the analytical method used for the PAH analyses.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, the data are acceptable for use and some data qualifications were applied to the sample results by the laboratory for results detected below the reporting limit. The Data Summary Report in Attachment a indicates which sample results were qualified by the laboratory. Attachment B provides data qualifier definitions for those qualifiers applied by the laboratory.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 312-424-3300.

Very truly yours,
Weston Solutions, Inc.

Target detection limits are those required by ASTM D7363 (C2 chyrsenes and larger PAHs, not applicable).
Actual experimental detection limits (reporting limits) are determined based on the signal to noise requirements stated in D7363.
ND = not detected.

Re: Data Review of Polynuclear Aromatic Hydrocarbon (PAH) Analysis
For Sediment Samples Collected on October 15, 2010
CLP Case No. 40638, SDG No. E01T8
Duck and Otter Creeks 2010 Data Gaps Investigation
Wood and Lucas Counties, Ohio
DCN: 1030-2F-ALGI

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for the five percent of the sediment samples collected in October 2010 for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks 2010 Data Gaps Investigation Site. This data review is of the analysis of PAH compounds for five sediment samples that include one field duplicate sample that were collected by WESTON and analyzed under Sample Delivery Group (SDG) number E01T8. The samples were validated in accordance with the "Quality Assurance Project Plan, Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, which includes using the U.S. EPA Contract Laboratory Program (CLP) National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed under the U.S. EPA CLP by ALS Laboratory Group (ALS) located in Salt Lake City, Utah, under case number 40638. Because only five percent of data is to be validated, SDG number E01T8 was selected for data validation.

Sediment samples were analyzed for PAHs using U.S. EPA CLP Statement of Work (SOW) SOM01.2 by gas chromatography/mass spectrometry (GC/MS) Selective Ion Monitoring (SIM) methodology. Table 2 provides a list of the PAHs that were analyzed. ALS did not provide a

Staged Electronic Data Deliverable (SEDD) with the CLP analytical package. Therefore, the Automated Data Review (ADR) software was not utilized to assist in reviewing this data.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for SDG E01T8. Attachment B to this report contains a printed summary report of sample results with hand-written qualifiers that were applied during the data review. Attachment C to this report contains a list of the data qualifiers associated with the sample results. The QC limits utilized were those stated in the Quality Assurance Project Plan (QAPP). If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF PAH DATA REVIEW

The holding times, initial calibration, continuing calibration, method blank, surrogates, and internal standards were within the QC limits.

The matrix spike (MS) and matrix spike duplicate (MSD) results were outside QC limits for percent recoveries and relative percent difference (RPD). RPDs were calculated for the field duplicate results all RPDs were outside QC limits. These QC exceedances as described below under Minor Problems.

Below is a review of the minor problems associated with QC failures and a summary of the data quality indicators associated with the PAH analysis for the sediment samples collected on November 2-4, 2010.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

MS and MSD Results. There was one MS/MSD pair associated with the sample for this SDG and it included two spiked compounds. The percent recoveries were outside QC limits (one was high and one was low) and one of the RPDs was outside QC limits. Because the surrogates in all samples were within QC limits (surrogate recoveries can also indicate matrix interference), the results in the parent sample only were flagged. In sample E01W2, detected results were flagged "J" and the quantitation limits for non-detected results were flagged "UJ" as estimated based on potential matrix interference.

Field Duplicate Results. There is one field duplicate associated with this SDG (identified with a "DP" suffix in the station location designation). The field duplicate was collected adjacent to the associated investigative sample. The field duplicate results and investigative sample results

were compared to a standard QC limit of 50 RPD or less. All the RPD values were above the 50 percent QC limit and there was a significant difference between the field duplicate and parent sample in most cases. The field duplicate sample was approximately 50 to 100 times the concentration of the parent sample. Because field duplicates are collected adjacent to the parent sample, these elevated RPDs indicate significant sample heterogeneity associated with PAHs in the sediment samples associated with this site. Table 3 presents the field duplicate results.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The CLP Contract Required Quantitation Limits (CRQL) for PAH compounds is 3.3 micrograms per kilogram (µg/kg). When adjusted for dilution factor and percent moisture, the laboratory achieved these reporting limits. Sensitivity was adequate for the PAH analyses of sediment samples collected on October 15, 2010, that are associated with SDG E01T8.

The laboratory reported results that were below the reporting limit but above the method detection limit. These results were flagged with a "J" by the laboratory and are considered estimated results.

Precision. Field precision is determined by evaluating the RPDs for the field duplicate results. The RPD values for the field duplicates were very high. The field duplicate results indicate sample heterogeneity associated with PAHs in the sediment samples.

Laboratory precision could not be evaluated as the MSD results were not valid due to the matrix spike amount being much lower than the sample concentrations and no other laboratory duplicates were analyzed.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy is usually evaluated by reviewing the percent recovery results for laboratory controls samples and MS/MSD results. Because LCS samples are not applicable to SOM01.2 and because of the matrix interference associated with the MS/MSD results, laboratory accuracy could not be evaluated by theses means. However, the continuing calibration verification results were all within their QC limits of less than 25 percent difference which indicates that laboratory accuracy is acceptable.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, the data are usable for comparison to the PAH screening criteria stated in the QAPP. Qualifications were added to the samples during the data review due to matrix interference in one of the samples. Attachment B includes the data summary sheets that show the hand-written data qualifications applied during data validation and the laboratory data qualifications. Definitions for the validation qualifiers applied and the laboratory qualifiers are included in Attachment C.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 847-918-4000.

Very truly yours,

Weston Solutions, Inc.

CHECKLIST FOR PAH ANALYTICAL DATA FOR CASE # 40638, SDG # E01T8

PAHs
BY CLP SOW SOM01.2

CASE# 40638
SDG# E01T8

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: Duck and Otter Sediment Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: March 10, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals ___	PCBs _____	pH _____	TOC _____
Dioxins/Furans _____	PAHs ___X___	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other _____

2. Were the target detection limits met for each parameter?

Yes	X
No	

The CLP CRQL for PAH compounds by GC/MS SIM is 3.3 micrograms per kilogram (µg/kg). When adjusted for dilution factor and percent moisture, the laboratory achieved these reporting limits.

3. Were the method blanks less than the established MDL for each parameter?

Yes	X	
No		(EXPLAIN)

The method blank contained no detections of target analytes.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

	Not Applicable	
Yes		
No	X	(EXPLAIN)

There are no field replicates associated with this SDG.

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes		
No	X	(EXPLAIN)

There is one field duplicate associated with this SDG (identified with a "DP" suffix in the station location designation). The field duplicate was collected adjacent to the associated investigative sample. The field duplicate results and investigative sample results were compared to a standard QC limit of 50 RPD or less. All the RPD values were above the 50 percent QC limit and there was a significant difference between the field duplicate and parent sample in most cases. The field duplicate sample was approximately 50 to 100 times the concentration of the parent sample. Because field duplicates are collected adjacent to the parent sample, these elevated RPDs indicate significant sample heterogeneity associated with SVOCs in the sediment samples associated with this site.

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

There was one MS/MSD pair associated with the sample for this SDG. The percent recoveries were outside QC limits (one was high and one was low). Because the surrogates in all samples were within QC limits (surrogate recoveries can also indicate matrix interference) and because there are not enough MS/MSD samples to determine if problem is wide spread, the results in the parent sample only were flagged. Detected results in sample E01W2 were flagged "J" and the quantitation limits for non-detected results were flagged "UJ" as estimated based on potential matrix interference.

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes		
No	X	(EXPLAIN)

There was one MS/MSD pair associated with the sample for this SDG. One of the RPDs was outside QC limits. Detected results in the parent sample, E01W2, were flagged "J" as estimated.

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

LCSs are not analyzed with PAH analysis by SOM01.2.

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

There were no QC limits specified in the QAPP; therefore, the QC limits specified in the CLP SOW were used for the initial calibration and continuing calibration verification (CCV) checks.

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Serial dilution is not applicable to SW-846 Method 8270C.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

Trip blanks and storage blanks are not applicable to SW-846 Method 8270C.

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

Samples were analyzed within the holding time requirement of 14 days to extraction from sample collection and 40 days to analysis following extraction.

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Laboratory duplicates were not analyzed with the samples.

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

Dry-weight concentrations are reported.

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “UNACCEPTABLE” marked above are described immediately following the “UNACCEPTABLE” marking in the corresponding item above.

In addition, some results were detected below the laboratory reporting limit and were flagged “J” as estimated for this discrepancy. The data are acceptable for use as qualified.

DATA QUALIFIER DEFINITIONS

LABORATORY DATA QUALIFIER DEFITIONS

D – This qualifier indicates that the sample was re-analyzed at a higher dilution factor than the original analysis.

E – The result exceeded the highest standard in the initial calibration range of the instrument. The result is an estimate.

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the quantitation limit).

U - The analyte was not detected above the reporting limit. The reported result is the laboratory reporting limit.

DATA VALIDATION DATA QUALIFIER DEFITIONS

J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the quantitation limit).

UJ - The analyte was not detected at a level greater than or equal to the adjusted quantitation limit. However, the reported adjusted quantiation limit is approximate and may be inaccurate or imprecise.

Re: Data Review of Grain Size Analyses
For Sediment Samples Collected on November 2-4, 2010
Duck and Otter Creeks 2010 Data Gaps Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2F-ALFI

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for sediment samples collected on November 2-4, 2010, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks 2010 Data Gaps Investigation (Duck and Otter) Site. This data review is for Grain Size analysis of 14 sediment samples that includes one field split that were collected by the WESTON Superfund Technical Assessment and Response Team (START). The samples were validated in accordance with the "Quality Assurance Project Plan, Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, which includes using the U.S. EPA Contract Laboratory Program National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed by TestAmerica (TA) located in South Burlington, Vermont, under the following two work orders:

- 200-2370-1
- 200-2416-1

The samples were analyzed for grain size by ASTM D422.

An individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis was not filled out for grain size because items listed on this checklist are not applicable to grain size analysis. The Attachment to this report contains the grain size data summary sheets. Below is the data review summary.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

GRAIN SIZE DATA REVIEW

Typical QC samples do not apply to grain size analysis as for chemical analytical parameters. Therefore, the only QC sample evaluated was the one field split associated with these work orders. This is discussed below.

There is one field split sample associated with the two work orders (identified with an "FS" suffix). According to the Field Sampling Plan, field split and duplicate samples were not required for grain size analysis. The relative percent differences (RPD) between the field split and parent sample were calculated to assist in evaluating the field split results. A QC limit for RPD for field splits was not stated in the QAPP; therefore, the field split results were compared to a standard QC limit of 50 RPD or less. The calculated RPDs were within this QC limit. Table 2 summarizes the field duplicate results and RPDs. The field split results were acceptable.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The QAPP stated that the laboratory would achieve a sensitivity in the percentile range which was met. Sensitivity was acceptable for grain size analyses.

Precision. Field precision was determined by evaluating the RPDs for the field split results. Because there was no QC limit stated in the QAPP, a standard QC limit of 50 RPD between the parent and duplicate result was used for the evaluation. The field split RPDs ranged from 0 to 24. See Tables 2 for individual RPD results. Field precision was acceptable.

There were no specific QC samples for laboratory precision which is in accordance with the QAPP.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. There were no specific QC samples for laboratory accuracy which is in accordance with the QAPP.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, the grain size data are usable. No qualification of the grain size data was required.

Re: Data Review of General Chemistry Analyses (DOC, hardness, pH, and ammonia)
For the Pore Water of Sediment Samples Collected on November 2-4, 2010
Duck and Otter Creeks 2010 Data Gaps Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2F-ALFI

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for sediment samples collected on November 2-4, 2010, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks 2010 Data Gaps Investigation (Duck and Otter) Site. This data review is for dissolved organic carbon (DOC), hardness, pH, and ammonia analyses of the pore water of 14 sediment samples that includes one field split sample that were collected by the WESTON Superfund Technical Assessment and Response Team (START). The samples were validated in accordance with the "Quality Assurance Project Plan, Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, which includes using the U.S. EPA Contract Laboratory Program National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed by Columbia Analytical Services (CAS) located in Kelso, Washington, under the following six work orders:

- K1012377
- K1012381
- K1012413
- K1012416
- K1012421
- K1012529

Pore water was extracted from the sediment samples and then the pore water was analyzed for DOC using U.S. EPA Method 415.1; for hardness (as calcium carbonate) using Standard Method (SM) 2340B and U.S. EPA SW-856 Method 6010B; for pH using SM 4500-H+B; and for ammonia (as nitrogen) using SM 4500-NH3E. CAS provided WESTON with a staged electronic data deliverable (SEDD) that was used in conjunction with the Automated Data Review (ADR) software to assist in reviewing the data. All SEDDs were imported into the ADR software for

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

review by the software program and all data was checked for completeness. Five percent of the data was put through a full data validation. Therefore, one of the work orders, K1012377, was selected for the full data validation. Work order K1012377 contained two sediment samples including one field split sample for the general chemistry parameters of pore water.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for work order K1012377. Attachment B to this report contains a printed report from ADR that provides a summary of results with qualifiers applied by the laboratory and the ADR program. Attachment C contains the data qualifier definitions. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF GENERAL CHEMISTRY DATA REVIEW

As stated above, five percent of the data was fully validated. Work order K1012377 was selected for full data validation. In work order K1012377, calibration standards, calibration blanks, laboratory control samples (LCS), laboratory duplicates, matrix spike (MS) samples, and holding times were all within the QC limits as applicable to each method for DOC, pH, ammonia, and hardness. In accordance with the Field Sampling Plan, field duplicates and field splits were not to be collected for the pore water analyses; however, one field split sample was collected and the results were acceptable.

Through full data validation and the ADR program, two problems with the quality control indicators was discovered. For the pH analyses, the holding time limit was exceeded for one sample. In addition, there was minor contamination below the reporting limit in the method blank; however, no qualification was required because the sample results were much greater.

Below are a description of the minor problems with QC failures and a review of the data quality indicators.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

Holding Times. The holding times for DOC, ammonia, and hardness were acceptable. For pH, the method states that samples should be analyzed as soon as possible. Pore water sample DC-17 was analyzed 17 days from sample collection which is excessive. The pH result in sample DC-17 was flagged “J” as estimated.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Method Blanks. Ammonia was detected in a method blank above the method detection limit but below the reporting limit. Sample results were much greater than the method blank concentration and therefore, no qualifications were required.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The laboratory reporting limits as stated in the QAPP was met for all samples when adjusted for the dilution factors. Sensitivity was acceptable.

Precision. Field precision was evaluated by evaluating the RPDs for the one field split sample. For the field split, the RPDs ranged were all below a standard QC limit of 50 percent. Table 2 summarizes the field split results. Field precision was evaluated and found to be acceptable.

Laboratory precision was determined by evaluating the relative percent difference (RPD) value for the laboratory duplicates for DOC, pH, and ammonia, and the RPD values for the LCS duplicate sample for hardness. The RPD values were all within the QAPP-stated QC limits. The mean RPDs for laboratory duplicates ranged from 0 to 8 percent. Table 3 summarizes the laboratory precision results. The laboratory precision was acceptable for the DOC, pH, ammonia, and hardness analyses.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for percent recovery for MS results for DOC and ammonia; and LCS results for DOC, hardness, pH, and ammonia.

The mean LCS recoveries ranged from 97 to 100 percent and are within the QAPP QC limits. The mean MS recoveries ranged from 100 to 108 percent and are within the QAPP specified QC limits. Laboratory accuracy is acceptable. The LCS and MS recoveries do not indicate a bias associated with the pH, ammonia, hardness, and DOC results.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, the data are acceptable for use and data qualifications were applied to one sample result for holding time exceedance for pH. The ADR Summary Report in Attachment B indicates which sample results were flagged during data validation and the reason for the qualification. The laboratory data qualifiers applied are also indicated on the ADR Summary

Report in Attachment B. Attachment C provides data qualifier definitions for those qualifiers applied during data validation and by the laboratory.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 312-424-3300.

Very truly yours,
Weston Solutions, Inc.

Lisa Graczyk

TABLE 2
FIELD SPLIT RESULTS

Analyte	Sample: DC-19FS		
	Sample Result (mg/L)	**Replicate Result (mg/L)**	**RPD**
Ammonia as Nitrogen	8.12	8.53	5
DOC	50.4	40.6	22
Hardness, as CaCO3	299	309	3
pH (pH units)	7.32	7.39	1

Notes:
CaCO3 – Calcium Carbonate
DOC – Dissolved Organic Carbon
mg/L – Milligram per liter
RPD – Relative Percent Difference

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

TABLE 3
QUANTITATIVE DATA ASSESSMENT

	Analytical Precision	Analytical Accuracy/Bias	
Analyte	**Mean Laboratory Duplicate or LCS/LCSD RPD (%) (n=3 for DOC; n=2 for pH, Ammonia, Hardness)**	**Mean MS Recovery (%) (n=3 for DOC; n=2 for Ammonia)**	**Mean LCS Recovery (%) (n=3 for DOC, pH; n=4 for Ammonia)**
DOC	8	100	102
Hardness	0	NA	108/104*
pH	1	NA	100
Ammonia	2	97	100

Notes:
* For hardness, a result is calculated from the results for calcium and magnesium. Therefore, the values listed for mean MS and mean LCS are for calcium/magnesium.

DOC – Dissolved Organic Carbon
LCS – Laboratory Control Sample
MS – Matrix Spike
NA – Not Applicable
RPD – Relative Percent Difference

QA/QC ANALYSIS CHECKLIST FOR GENERAL CHEMISTRY PARAMETERS FOR WORK ORDER K1012377

GENERAL CHEMISTRY PARAMETERS

Dissolved Organic Carbon (DOC) by U.S. EPA Method 415.1
Hardness (as calcium carbonate) by SM 2340B and SW-846 6010B
pH by SM 4500-H+B
Ammonia (as nitrogen) by SM 4500-NH3E

WORK ORDER # K1012377

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: GLNPO Duck and Otter 2010 Data Gaps Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: February 18, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals _____	PCBs _____	pH ___X__	TOC _____
Dioxins/Furans _____	PAHs _____	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other ___X (DOC, ammonia, and hardness)

2. Were the target detection limits met for each parameter?

Yes X
No _____ (EXPLAIN)

The reporting limits as stated in the QAPP were achieved when adjusted for dilution factors.

3. Were the method blanks less than the established MDL for each parameter?

Yes _____
No X (EXPLAIN)

A method blank was analyzed with the DOC, ammonia, and hardness analyses.

For the ammonia analyses, ammonia was detected below the reporting limit but above the method detection limit in the method blank. Because the sample results were above the reporting limit and significantly above the method blank results, no qualifications are required.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes	X	
No		(EXPLAIN)

There are no field replicate samples associated with this work order.

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Internal standards and surrogates are not applicable to the pH, ammonia, hardness, and DOC analyses.

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

An MS was analyzed with the DOC and ammonia analyses.

General Chemistry Parameters Checklist
GLNPO Duck and Otter Creeks 2010 Data Gaps Investigation
Columbia Analytical Services
Laboratory Work Order #: K1012377

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

.

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

.

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

Interference check sample results are applicable to hardness analysis only.

General Chemistry Parameters Checklist
GLNPO Duck and Otter Creeks 2010 Data Gaps Investigation
Columbia Analytical Services
Laboratory Work Order #: K1012377

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Serial dilution results were not analyzed with the analyses.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

Trip blanks and storage blanks are not applicable to to pH, flashpoint, TDS, and TSS analyses.

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	X	
No		(EXPLAIN)

17. Are measured dry-weight contaminant concentrations reported?

Yes	Not Applicable	
No		(EXPLAIN)

18. Please provide details for all of the "UNACCEPTABLE" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “UNACCEPTABLE” marked above are described immediately following the “UNACCEPTABLE” marking in the corresponding item above.

The data are acceptable for use.

Re: Data Review of Acid Volatile Sulfide (AVS) and Simultaneously Extracted Metals (SEM) Analysis
For Sediment Samples Collected on November 2-4, 2010
Duck and Otter Creeks 2010 Data Gaps Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2F-ALFI

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for sediment samples collected on November 2-3, 2010, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks 2010 Data Gaps Investigation Site. This data review is for AVS and SEM analysis of 18 sediment samples that includes one field split and four field duplicate samples that were collected by the Weston Solutions Inc. (WESTON) Superfund Technical Assessment and Response Team (START). The samples were validated in accordance with the "Quality Assurance Project Plan, Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, which includes using the U.S. EPA Contract Laboratory Program National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed by Columbia Analytical Services (CAS) located in Kelso, Washington, under the following six work orders:

- K1012377
- K1012381
- K1012413
- K1012416
- K1012421
- K1012529

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

The samples were analyzed for AVS using U.S. EPA Method 831/R-91-100 and for SEM using U.S. EPA Method 831/R-91-100 and SW-846 Method 6010B. Table 2 summarizes the SEMs that were analyzed. CAS provided WESTON with a staged electronic data deliverable (SEDD) that was used in conjunction with the Automated Data Review (ADR) software to assist in reviewing the data. All SEDDs were imported into the ADR software for review by the software program and all data was checked for completeness. Five percent of the data was put through a full data validation. Therefore, one of the work orders, K1012377, was selected for the full data validation. Work order K1012377 contains two sediment samples, including one field split, for AVS and SEM analysis.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for work order K1012377. Attachment B to this report contains a printed report from ADR that provides a summary of results with qualifiers applied by the laboratory and the ADR program. Attachment C contains the data qualifier definitions. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF METALS DATA REVIEW

As stated above, five percent of the data was fully validated. Work order K1012377 was selected for full data validation. In work order K1012377, the holding times, calibration standards, calibration blanks, serial dilutions, laboratory control samples (LCS), and method blanks were all within the QC limits. All sample results were based on a dry weight for the AVS and SEM analyses.

For the remaining work orders, the ADR program indicated that all holding time limits, method blanks, LCSs, laboratory duplicates, matrix spikes (MS), and matrix spike duplicates (MSD) were within QC limits.

There were some problems with field split and field duplicate recoveries indicating some issues with sample heterogeneity.

Below are a description of the minor problems with QC failures and a review of the data quality indicators.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

Field Splits. The QAPP stated that field splits (replicates) would be collected at a 10 percent frequency. There were a total of 13 field investigative samples and one field split collected (see

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Table 1 for which samples are designated as field splits). Therefore, the QAPP-stated frequency was very close to being met (split collected at an 8 percent frequency). A QC limit for field splits was not stated in the QAPP; therefore, a default QC limit of 50 RPD was used to evaluate field split results. The RPDs are below 50 RPD except for copper which has and RPD of 64 percent. This likely indicates some heterogeneity associated with copper in this sample and does not affect data usability. Tables 3 summarizes the field split results.

Field Duplicates. The QAPP stated that field duplicate samples would be collected at a 10 percent frequency. There were a total of 13 field investigative samples and four field duplicates collected (see Table 1 for which samples are designated as field duplicates). Therefore, the QAPP-stated frequency was met for the field duplicates. A QC limit for field duplicates was not stated in the QAPP; therefore, a default QC limit of 50 RPD was used to evaluate field duplicate results. The RPDs for AVS and some SEMs were outside this QC limit in some of the field duplicates. Table 4 summarizes the field duplicate results. Below is a description of the QC limit exceedances.

- **Field duplicate pair OC-27 and OC-27-DP.** In this field duplicate pair, the RPD for AVS is 134. This indicates heterogeneity associated with AVS in this sample. No qualifications are applied and data usability is not affected.

- **Field duplicate pair OC-31 and OC-31DP.** In this field duplicate pair, the RPD for AVS is 53 and the RPD for copper is 82. This indicates heterogeneity associated with AVS and copper in this sample. No qualifications are applied and data usability is not affected.

- **Field duplicate pair OC-32 and OC-32DP.** In this field duplicate pair, the RPD for AVS is 60 and the RPD for copper is 77. This indicates heterogeneity associated with AVS and copper in this sample. No qualifications are applied and data usability is not affected.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the attachments.

Sensitivity. Several of **t**he sediment reporting limits for SEMs as stated in the QAPP were not met; in many instances, this was due to correction for high percent moisture. Because there are no screening levels for SEMs, data usability is not affected. The reporting limits for AVS as stated in the QAPP were met. Sensitivity was adequate for the AVS and SEM analyses of sediment samples collected on November 2-4, 2010.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Precision. Field precision was evaluated by evaluating the mean RPDs for field split and field duplicate results. For the field splits, mean RPDs ranged from 3 to 64 percent and for the field duplicates, mean RPDs ranged from 6 to 71 percent. Although the mean RPD values for copper and AVS slightly exceeded the QC limits, this does not affect data usability. Field duplicates are collected adjacent to the parent sample and the slightly high RPDs represent sample heterogeneity. Field precision was evaluated and found to be acceptable. Table 5 summarizes the field precision results.

Laboratory precision was determined by evaluating the RPD values between the laboratory duplicate and parent sample results. RPD values for laboratory duplicates are within QC limits. Table 5 summarizes the mean RPDs for laboratory duplicates. The laboratory precision was acceptable for the AVS and SEM analyses.

Accuracy. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for percent recovery for MS/MSD and LCS results. The LCS and MS recoveries were within the QC limits for all samples. Table 5 summarizes the accuracy estimates for this project. The mean MS recoveries ranged from 90 to 96 percent and the mean LCS recoveries ranged from 92 to 105 percent. Laboratory accuracy was acceptable. Based on the mean recoveries for both the LCSs and MSs, there appears to be no bias associated with the AVS and SEM analyses.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All sample results were received.

In summary, there were some minor problems associated with field split and duplicate results. No qualifiers were applied during data validation. The ADR Summary Report in Attachment B summarizes the results. Attachment C provides data qualifier definitions for those qualifiers applied by the laboratory.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 312-424-3300.

Very truly yours,
Weston Solutions, Inc.

Lisa Graczyk

QA/QC ANALYSIS CHECKLIST FOR AVS AND SEM FOR WORK ORDER K1012377

ACID VOLATILE SULFIDE (AVS) BY METHOD 831/R-91-100 AND SIMULTANEOUSLY EXTRACTED METALS (SEM) BY U.S. EPA SW-846 METHOD 6010B

CAS Work Order #: K1012377

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: Duck and Otter Creeks 2010 Data Gaps Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: February 8, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals ___	PCBs _____	pH _____	TOC _____
Dioxins/Furans _____	PAHs _____	Pesticides _____	DO _____
AVS __X___	SEM Metals _X_	Particle Size _____	Other _____

2. Were the target detection limits met for each parameter?

Yes	X (AVS)	
No	X (SEM)	(EXPLAIN)

The sediment reporting limits for SEMs as stated in the QAPP were not met; in many instances, this was due to correction for high percent moisture. Because there are no screening levels for SEMs, data usability is not affected.

3. Were the method blanks less than the established MDL for each parameter?

Yes	X	
No		(EXPLAIN)

AVS and SEMs were not detected in the method blank above the reporting limit.

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes		
No	X	(EXPLAIN)

There is one field replicate (split) associated with this work order (identified with an "FS" suffix in the station location designation). The field replicate results and investigative sample results were compared to a standard QC limit of 50 RPD or less.

For the field split pair, DC-19 and DC-19FS, this limit was exceeded for copper. The RPD for copper was 64 percent. This shows some minor heterogeneity regarding copper in this sample matrix.

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

There is no field duplicate sample associated with this work order for the AVS and SEM analyses.

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

Surrogates and internal standards are not applicable to the AVS and SEM analyses.

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

The LCS recovery met the QAPP QC limits for the AVS and SEM analyses.

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

The continuing calibration verification (CCV) standards were within QC limits.

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

Continuing calibration blanks (CCB) contained no detections above the reporting limits.

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

Interference check samples are not applicable to the AVS method.

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

Serial dilution is not applicable to the AVS method.

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

Dry-weight concentrations are reported.

18. Please provide details for all of the "EXPLAIN" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “EXPLAIN” marked above are described immediately following the “EXPLAIN” marking in the corresponding item above.

The data are acceptable for use as qualified.

Re: Data Review of Total Petroleum Hydrocarbons (TPH) as Gasoline Range Organics (GRO), Diesel Range Organics (DRO), and Residual Range Organics (RRO) Analysis
For Sediment Samples Collected on November 2-4, 2010
Duck and Otter Creeks 2010 Data Gaps Investigation
Wood and Lucas Counties, Ohio
DCN: 1269-2F-ALFI

Dear Ms. Jones and Mr. Vaidya:

The United States Environmental Protection Agency (U.S. EPA) tasked Weston Solutions, Inc., (WESTON®) to perform data validation for sediment samples collected on November 2-4, 2010, for the Great Lakes National Program Office (GLNPO) Duck and Otter Creeks 2010 Data Gaps Investigation (Duck and Otter) Site. This data review is for TPH as GRO, DRO, and RRO analyses of 70 sediment samples that include 6 field splits and 6 field duplicates that were collected by the WESTON Superfund Technical Assessment and Response Team (START). The samples were validated in accordance with the "Quality Assurance Project Plan, Duck and Otter Creeks Data Gaps Investigation" dated September 28, 2010, which includes using the U.S. EPA Contract Laboratory Program National Functional Guidance for Organic and Inorganic Data Review. Table 1 provides a summary of the samples included in this review. All tables are presented at the end of this report.

The samples listed in Table 1 were analyzed by Columbia Analytical Services (CAS) located in Kelso, Washington, under the following six work orders:

- K1012377
- K1012381
- K1012413
- K1012416
- K1012421
- K1012529

The samples were analyzed for TPH using U.S. EPA SW-846 Method 8015. CAS provided WESTON with a staged electronic data deliverable (SEDD) that was used in conjunction with the Automated Data Review (ADR) software to assist in reviewing the data. All SEDDs were imported into the ADR software for review by the software program and all data was checked for

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

completeness. Five percent of the data was put through a full data validation. Therefore, one of the work orders, K1012416, was selected for the full data validation. Work order K1012416 contained nine sediment samples, including three field duplicates, for TPH analysis.

Attachment A to this report contains the individual Quality Assurance/Quality Control (QA/QC) Analysis Checklist for Sediment Chemistry Analysis for work order K1012416. Attachment B to this report contains a printed report from ADR that provides a summary of results with qualifiers applied by the laboratory and the ADR program. Attachment C contains the data qualifier definitions. The QC limits utilized were those stated in the QAPP. If there was not a QC limit specified in the QAPP, then the method or laboratory-determined QC limits were used. Below is the data review summary.

SUMMARY OF TPH DATA REVIEW

As stated above, five percent of the data was fully validated. Work order K1012416 was selected for full data validation. In work order K1012416, the holding times, surrogates, calibration standards, laboratory control samples (LCS), matrix spike (MS) samples, matrix spike duplicate (MSD) samples, and field duplicates were all within the QC limits. All sample results were based on a dry weight for the TPH analyses.

Through full data validation and the ADR program, some minor problems with the quality control indicators were discovered. In all work orders, there were minor detections of GRO in the method blanks requiring some GRO results to be flagged as not detected. The percent recoveries for some of the MS/MSD samples were outside the QC limits requiring one result to be qualified as estimated.

The QAPP stated that field splits (replicates) and field duplicate samples would be collected at a 10 percent frequency. There were a total of 58 field investigative samples and six field duplicates and six field splits collected (see Table 1 for which samples are designated as field duplicates and splits). The QAPP-stated frequency was met for the field duplicates and splits. A QC limit for field splits and field duplicates was not stated in the QAPP; therefore, a default QC limit of 50 relative percent difference (RPD) was used to evaluate field split and duplicate results. The RPDs for most of the field duplicates and field splits are below 50 RPD. Tables 2 and 3 summarize the field split and field duplicate results, respectively.

Below are a description of the minor problems with QC failures and a review of the data quality indicators.

MINOR PROBLEMS

Minor problems with QC failures are noted below.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Method Blanks. In all six work orders, method blanks contained detections of GRO below the reporting limit. In some samples, GRO results were detected below the reporting limit and at a concentration similar to the method blank concentration. These GRO results were flagged "U" as not detected. The ADR Summary Report in Attachment B shows which GRO results were flagged "U" based on method blank results.

MS and MSDs. There were a total of nine MS/MSD pairs associated with the DRO/RRO analyses and seven MS/MSD pairs associated with the GRO analyses. All GRO MS/MSD recoveries were within QC limits.

For the DRO/RRO analyses, the percent recoveries for three of the nine MS/MSD pairs were outside QC limits. In all of these instances except one, no qualifications were required in accordance with data validation guidance because the sample concentrations were more than four times the amount of the spike added making the spike recovery difficult. The exception was for DRO in the MS/MSD associated with sample DC-13-04. DRO was flagged "J" as estimated in sample DC-13-04 due to apparent matrix interference. The ADR Summary Report in Attachment B shows which DRO result was flagged "J" based on matrix spike results.

Field Splits. There were six field split samples associated with these work orders. Of the six field splits, only GRO in one of the splits, DC-19-04FS, exceeded the standard QC limit of 50 RPD. This likely indicates some sample heterogeneity associated with GRO in this one sample and data usability is not affected. Table 2 summarizes the field split results and RPDs.

Field Duplicates. There were six field duplicate samples associated with these work orders. Of the six field duplicates, two GRO RPDs, two DRO RPDs, and one RRO RPD exceeded the standard QC limit of 50 RPD. Field duplicates are collected adjacent to the parent sample and are not from the same homogenized sample aliquot. These elevated RPDs indicate some sample heterogeneity associated with these TPH compounds in the associated samples. Data usability is not affected. Table 3 summarizes the field duplicate results and RPDs.

Target Compound Identification. Target compound identification followed the method and was acceptable; however, the chromatograms for the petroleum product identified in the samples were not exact matches to the chromatograms for the DRO, RRO, and GRO standards used. CAS qualified most sample results to provide further details regarding the chromatograms. The qualifiers used were "H", "O", and "Y" and are defined as follows:

- An "H" qualifier indicates that the chromatographic fingerprint does resemble a petroleum product but the elution pattern indicates a greater amount of heavier molecular weight constituents than the calibration standard.
- An "O" qualifier indicates that the chromatographic fingerprint resembles an oil product, but does not match the calibration standard.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

- A "Y" qualifier indicates that the chromatographic fingerprint resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.

DATA QUALITY INDICATORS REVIEW

Many the data quality indicators (sensitivity, precision, accuracy, and completeness) were evaluated through the data validation procedures which are summarized above and discussed in detail in the Attachment.

Sensitivity. The laboratory reporting limits stated in the QAPP were 25 milligrams per kilogram (mg/kg) for DRO, 100 mg/kg for RRO, and 25 mg/kg for GRO. In many instances these reporting limits were not met; most due to dilutions and correction for percent moisture, The laboratory reported down to method detection limits which were lower than the reporting limits (all sample results reported below the reporting limit were qualified "J" as estimated). The elevated reporting limits do not affect data usability because there were detections of TPH compounds in the samples in most instances that the reporting limit was elevated and there are no screening levels to compare data to for TPH. Therefore, sensitivity was adequate for the DRO, RRO, and GRO analyses of sediment samples collected on November 2-4, 2010.

Precision. Field precision was determined by evaluating the RPDs for the field split and field duplicate results. The mean RPD for field splits ranged from 11 to 27 percent and the mean RPD for field duplicates ranged from 31 to 58 percent. With the exception of the mean RPD for GRO in the field duplicates, all mean RPDs are below the standard QC limit of 50 RPD (see discussion of field duplicates under Minor Problems above). Field precision was evaluated and found to be acceptable. Table 4 summarizes the mean field split and duplicate RPDs for each analyte.

Laboratory precision was determined by evaluating the RPD values between MS and MSD results. The mean MS/MSD RPD values were within QC limits. The mean RPD values ranged from 4 to 10 percent. Laboratory precision was acceptable. Table 4 summarizes the mean RPDs for MS/MSDs.

Accuracy/Bias. Accuracy is a measure of the agreement between an observed value and an accepted reference value. Laboratory accuracy was evaluated by reviewing the QC criteria for percent recovery for LCS results. All LCS mean percent recoveries were within the QAPP QC limits. Table 4 summarizes the accuracy estimates for the TPH analyses. The mean percent recoveries for LCSs ranged from 88 to 94 percent. Laboratory accuracy was acceptable. The mean LCS recoveries indicate a slightly low bias associated with the GRO, DRO, and RRO analyses.

This document was prepared by Weston Solutions, Inc., expressly for U.S. EPA. It shall not be released or disclosed in whole or in part without the express, written permission of U.S. EPA.

Completeness. Completeness is a measure of the amount of valid data obtained compared to the amount of data that was planned to be collected under normal conditions. All samples results were received.

In summary, there were some minor problems with QC failures as discussed above that required some results to be flagged. The ADR Summary Report in Attachment B indicates which sample results were flagged during data validation and the reason for the qualification. The laboratory data qualifiers applied are also indicated on the ADR Summary Report in Attachment B. Attachment C provides data qualifier definitions for those qualifiers applied during data validation and by the laboratory.

If there are any questions or comments regarding this report, please do not hesitate to contact WESTON START at 312-424-3300.

Very truly yours,
Weston Solutions, Inc.

QA/QC ANALYSIS CHECKLIST FOR TPH FOR WORK ORDER K1012416

TPH AS GRO, DRO, AND RRO

BY SW-846 METHOD 8015

CAS Work Order #: K1012416

QA/QC Analysis Checklist for Sediment Chemistry Analysis

GRANT/IAG NUMBER: Not Applicable
PROJECT NAME: Duck and Otter Creeks 2010 Data Gaps Investigation
REVIEWER: Lisa Graczyk, WESTON START
DATE: February 14, 2011

1. What sediment chemistry data has been collected (CHECK ALL THAT APPLY)?

Total Metals ____	PCBs _____	pH _____	TOC _____
Dioxins/Furans _____	PAHs _____	Pesticides _____	DO _____
AVS _____	SEM Metals _____	Particle Size _____	Other __X (TPH)

2. Were the target detection limits met for each parameter?

Yes _____
No X (EXPLAIN)

The reporting limits as stated in the QAPP were not met in many instances mostly due to the high concentrations of the target analytes in the samples and dilutions required, and percent moisture corrections. In addition, there were no screening criteria presented in the QAPP for TPH. Therefore data usability was not affected by the somewhat elevated reporting limits.

3. Were the method blanks less than the established MDL for each parameter?

Yes _____
No X (EXPLAIN)

GRO was detected in two method blanks below the reporting limit at 1.4 and 1.5 mg/kg. Three sample results had GRO detected below the reporting limit and had a similar concentration as the blank results. The GRO results in samples OC-26-02, OC-26-02DP, and OC-27-02 were flagged "U" as not detected.

Laboratory Work Order #: K1012416

4. Did the results of Field Replicate Analysis vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

5. Did the results of the Field Duplicates Analysis vary by less than the % RPD specified in the QAPP?

Yes	X	
No		(EXPLAIN)

6. Did the surrogate spike/internal standards recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

7. Did the MS/MSD recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

8. Did the RPD (%) of the MS/MSD sample set meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

TPH Checklist
Duck and Otter Creeks 2010 Data Gaps Investigation
Columbia Analytical Services
Laboratory Work Order #: K1012416

9. Did the LCS recoveries meet the limits set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

10. Did the calibration verification standards (ICVs and CCVs) meet the requirements set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

11. Did the calibration blanks (ICBs and CCBs) meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		

12. Did the interference check samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

13. Did the serial dilution samples meet the limits set forth in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

14. Were any level of contaminants detected above the MDL for the trip blanks and storage blanks?

Yes	Not Applicable	
No		(EXPLAIN)

TPH Checklist
Duck and Otter Creeks 2010 Data Gaps Investigation
Columbia Analytical Services
Laboratory Work Order #: K1012416

15. Did all required analyses take place within the required holding time protocols set forth in the QAPP?

Yes	X	
No		(EXPLAIN)

16. Did the laboratory duplicates vary by less than the % RPD specified in the QAPP?

Yes	Not Applicable	
No		(EXPLAIN)

17. Are measured dry-weight contaminant concentrations reported?

Yes	X	
No		(EXPLAIN)

18. Please provide details for all of the "EXPLAIN" marked above. Include details on the specific analytes affected by any QA/QC discrepancies, and recommendations regarding usability of data.

Any items with “EXPLAIN” marked above are described immediately following the “EXPLAIN” marking in the corresponding item above.

Note that the laboratory qualified many of the sample results with a “J”, “O”, “Y”, and “D” are defined as follows:

- A “J” qualifier indicates that the sample result should be considered estimated because it was detected below the reporting limit.
- An “O” qualifier indicates that the chromatographic fingerprint resembles an oil product, but does not match the calibration standard.
- A “Y” qualifier indicates that the chromatographic fingerprint resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- A “D” qualifier indicates that the reported result is from a dilution.

TPH Checklist
Duck and Otter Creeks 2010 Data Gaps Investigation
Columbia Analytical Services
Laboratory Work Order #: K1012416

All of these results should be considered estimated. Note that the sample chromatographic patterns not matching up to the standards is to be expected because of the weathering/degrading of the petroleum products over time.

In addition, some results were flagged by the laboratory with a “D” to indicate that the sample result is from a dilution.

The data are acceptable for use as qualified.
