Re: Lead Service Line/Fixture Mapping Project
Narrative & Mapping

Skyline Trailer Court water system contains NO Lead/Copper lines, fittings or fixtures. All well house fittings are PVC as well as all service line connections. Each lot has a dedicated brass shut-off and brass back-flow valve. All PVC lines were installed after 1986 when lead service lines were banned.

The water supplied is provided by two wells. Well #1 is located within the pump house, at the SW corner of the park. Well #2 is located approximately 100 ft North of the pump house in a green area. There is also a City of Logan water line tap inside the well house, providing our back-up source, and runs south from Parkway Drive directly SE to the well house.

Skyline utilizes a loop system which runs parallel to the sidewalks on the Main Street, A total of six (6) shut-off sites are placed along the loop. Lines from the loop run through shut-off valves placed at approximately every second lot located on the main street. From each shut-off valve, lines run to four lots.

Leap/Copper Test Sites are indicated on the attached copy of our spreadsheet, as previously provided to Ohio EPA.

Should there be any concerns or questions, please contact us at rondelb@roadrunner.com
Or call us at 740-385-6944.

Sincerely,

Roxanne Bailey
