1 Introduction

This site characterization report documents the activities associated with sediment sampling within the Swan Creek Phase 2 in the Maumee Area of Concern (AOC) and presents the investigation findings. The purpose of the investigation was to assist the Great Lakes National Program Office (GLNPO) in assessing the nature and extent of sediment contamination, identifying sediment contamination hotspots, and identifying areas of potential sources with ongoing contamination that require further evaluation. The investigation was conducted for the U.S. Environmental Protection Agency's (EPA's) GLNPO under Task Order No. 0013, Contract No. EP-R5-11-09. The project area is divided into two zones. Zone 1, the portion of the project area previously sampled in 2011, extends downstream from the South Hawley Street Bridge to the creek mouth and consists of the lower 2 miles of Swan Creek. Zone 2 of the project area extends approximately 1.75 miles upstream from the South Hawley Street Bridge to the fish passage project at Highland Park. The following activities were conducted as part of the investigation:

- Conduct analytical data gap sampling for polychlorinated biphenyls (PCBs) in Zone 1 to assess the nature and extent of contamination.
- Conduct analytical sampling for PCBs, a list of 17 polycyclic aromatic hydrocarbons (PAH-17), oil and grease, diesel range organics (DRO)/oil range organics (ORO), mercury, total metals, and total organic carbon (TOC) in Zone 2 to assess the nature and extent of contamination.
- Perform analytical sampling on a subset (approximately 10 percent) of samples in Zone 2 for semivolatile organic compounds (SVOCs) to assess the nature and extent of contamination.
- Perform grain size analyses to evaluate the sediment's physical characteristics.

The site characterization report is organized as follows:

- Section 1 presents the site setting, background, and previous investigations.
- Section 2 presents a description of the field investigation activities.
- Section 3 presents the investigation results.
- Section 4 provides conclusions of the investigation.
- Section 5 provides the references cited in this document.

1.1 Site Setting

The Swan Creek Phase 2 project area is located in the Maumee AOC within the city of Toledo, Ohio. The project area begins at the mouth of Swan Creek where it discharges into the Maumee River and continues upstream of Swan Creek for 3.75 miles, as shown in Figure 1. The land use surrounding the project area is primarily industrial and commercial near the creek mouth, changing to primarily residential surrounding the upstream reaches.

1.2 Background

Current and historical industrial activities in the Swan Creek watershed include gas and chemical manufacturing plants, municipal landfills, and other industrial activities, all of which may have contributed to contamination of the river sediments. Contaminated sediments in the project area likely contribute to the beneficial use impairments (BUIs) of the AOC, but there is not enough historical data from Swan Creek to assess the impact of the contamination. The following BUIs have been identified for Swan Creek (EPA 2005):

- Degradation of fish and wildlife populations
- Fish tumors or other deformities
- Bird or animal deformities or reproductive problems
- Degradation of benthos
- Eutrophication or undesirable algae
- Beach closings

- Degradation of aesthetics
- Loss of fish and wildlife habitat

1.3 Previous Investigations

The Ohio Environmental Protection Agency has identified creosote contamination as a possible contributor to BUIs within the watershed, but other chemical contamination needed to be evaluated. Previous sampling data from Zone 1 indicates that Swan Creek sediments are contaminated by oil and grease, mercury, heavy metals, DRO, ORO, PCB, and SVOCs, and PAHs (Weston Solutions, Inc. 2012).

Based upon previous investigation activities, water depths in Zone 1 range from 8 to 12 feet at the creek mouth to 3 to 5 feet near Hawley Street. Sediment thickness was observed to be approximately 4 to 5 feet near the mouth and approximately 2 feet near Hawley Street.

No sampling was previously conducted within Zone 2 of Swan Creek by US EPA.

2 Field Investigation Activities

Field investigation activities were conducted in accordance with the field sampling plan (FSP) and quality assurance project plan (QAPP) (CH2M HILL 2014a and 2014b). Deviations from the FSP and QAPP are presented in Table 1.

The sediment investigation was conducted from June 2 through 6, 2014. Average weather conditions during the field investigation were sunny with mild to warmer temperatures (temperatures ranging from 50 degrees Fahrenheit [°F] to 74°F), with wind speeds between 5 and 30 miles per hour. The only inclement weather experienced during the sampling event was the afternoon of June 4.

2.1 Sediment Sampling

2.1.1 Global Positioning Systems

A real-time kinematic (RTK) global positioning system (GPS) was used to position the sampling vessel for sediment probing and sampling. Water surface elevation and the sediment surface elevation were collected at each sampling location. The sampling and support vessels and the GPS for the sediment investigation were provided by team subcontractor Affiliated Researchers. Horizontal GPS data were reported in the Universal Transverse Mercator Zone 16, North American Datum of 1983. Elevations are referenced to the North American Vertical Datum of 1988. Two local benchmarks (Table 1 in Affiliated Researchers' 2014 Data Summary Report) were used to provide the required quality assurance (QA)/quality control (QC) for the GPS equipment.

During the field effort, the average GPS accuracies were as follows: Easting -0.05 foot; Northing 0.03 foot; and vertical -0.03 foot. The GPS coordinates of each location were collected in accordance with field operating procedure (FOP)-03, *Global Positioning System Procedures*. Additionally, GPS data checklists were completed daily and are included Appendix A.

2.1.2 Vibracore Sediment Collection

Twenty of the 30 proposed sample cores were obtained for chemical analysis using ponar and vibracore sampling techniques. Sediment core samples were collected in accordance with FOP-02, *Sediment Core Collection,* and sediment grab samples were collected in accordance with FOP-01, *Sediment Grab Sampling*. Six of the 30 sampling locations (SD036, SD037, SD042, SD043, SD044, and SD045) were obtained using hand coring methods. Logjams within the creek made sampling locations SD038, SD039, SD040, and SD041 inaccessible, and no samples were attempted/collected from these locations (Figures 4.2 and 4.3). Sediment cores were collected using vibracore equipment and 3-inch-diameter polycarbonate tubes. Hand cores were collected using 2-inch-diameter polycarbonate tubes that were progressed with a fencepost driver. Sediment was collected from up to three sample intervals at each core location at depth intervals of 0 to 0.5 foot, 0.5 to 2 feet, and 2 to 4 feet or refusal. The depth of each core sample is presented in Table 2. Sediment core locations are presented in Figures 2, 3.1–3.3, and 4.1-4.3.

Each sediment core sample was planned to be advanced to a maximum depth of 4 feet below the top of the soft sediment. Only core samples with a minimum of 60 percent recovery were accepted. If needed, up to three attempts were made to collect the core sample from the proposed sampling location. Second and third attempts were to be made within a 10-foot-diameter area of the planned core location if the first attempts did not achieve acceptable recovery. At sampling locations SD025, SD034, SD042, SD043, and SD046, no samples could be collected due to gravel or debris present on the surface of the creek bed. If no suitable material was identified for sampling at the proposed sampling location, the vessel would conduct additional reconnaissance within the area of the river approximately 100 feet upstream and downstream from bank to bank of the proposed sampling location in an attempt to find suitable material for sampling. If no location was found where a core could be taken, a ponar grab sample was attempted.

2.1.3 Sediment Processing and Characterization

The sediment cores were visually characterized per the Unified Soil Classification System (modified slightly for sediment characterization) in accordance with ASTM International D2488 standard practice. Cores were logged for sediment type, grain size, color, moisture, consistency, and other visual observations (staining, odor [if observed]). Digital photographs were taken of each core to document the undisturbed core structure. At each location, sediment for each sample interval was homogenized prior to being placed in containers. Unused sediment was disposed of in 55-gallon drums. The analyses performed on each discrete core sample are specified in Table 3. Samples were shipped to ALS Laboratories for analysis in accordance with FOP-05, *Sample Handling, Packaging, and Shipping*. Photographs of each core are included in Appendix B. Sediment core logs are included in Appendix C.

2.1.4 Field Equipment Decontamination

Disposable sampling equipment (core liners, aluminum pans, sampling utensils, etc.) was used for sample collection when possible. Decontamination of nondedicated sampling equipment was performed in accordance with FOP-04, *Field Equipment Cleaning and Decontamination Procedures*.

2.2 Quality Assurance/Quality Control Samples

QA/QC samples were collected at the frequency indicated in the FSP and QAPP (CH2M HILL 2014a and b). QA/QC samples collected included the following: field split, field duplicate samples, matrix spike (MS)/matrix spike duplicate (MSD) samples, and equipment blanks. Field split, field duplicate, and MS/MSD samples were collected at a minimum 5 percent frequency. In accordance with the FSP, MS/MSD samples were not collected for grain size. A summary of the field duplicate, field split, and MS/MSD sample locations is presented in Table 3.

2.3 Investigation-derived Waste

All personal protective equipment, other sampling waste (empty core liners, disposable sampling equipment), and sediment generated during the site activities was disposed of in 55-gallon drums as investigation-derived waste.

3 Investigation Results

3.1 Site Hydrology

Water depth is deepest at the mouth of the creek near Maumee River up to a maximum depth of approximately 12 feet and then gradually gets shallower upstream towards Highland Park. An anomaly to this trend is a deep area, approximately 10 feet deep that occurs near Otis Street (SD025).

3.2 Sediment Type and Distribution

Sediment thickness measured in accordance with FOP-01 varies throughout Swan Creek from no measurable sediment up to 7.2 feet. Visual representation of the sediment thicknesses observed at each sampling location is depicted in Figures 5 and 6.

3.3 Analytical Results

In accordance with the QAPP, analytical results for SVOCs (including the PAH-17 list), metals (including mercury), and PCBs were screened against probable effect concentrations (PECs) set in the investigation conducted in 2011 (Weston 2012) and the EPA Region 5 Ecological Regional Screening Levels (RSLs). The Region 5 RSLs are more conservative than the PECs; therefore, the following sections focus on the PEC exceedances.

A summary of the sediment screening criteria is presented in Table 4. A summary of sample locations with exceedances is presented in Table 5. One-hundred percent of the data were reviewed and validated by Critigen following the Stage 2A validation level, and 20 percent of the data were validated at Stage 2B as detailed in the Data Usability Report (CH2M HILL 2014c) provided as Appendix D. In addition, CB&I Federal Services, Inc. (CB&I) performed third-party validation of the data, the results of which are also included in the Data Usability Report as an attachment (CB&I 2014). Validated analytical results are presented in Appendix D. A discussion of the analytical results and exceedances of PECs screening levels are presented in the following subsections. While SD021 is located within Zone 1, it will also be included in the Zone 2 discussion due to its location near Zone 2, the analyses performed, and its chemical and physical characteristics.

Total PCBs and PAH Totals were calculated by summing the detected concentrations for each individual PCB Aroclor/PAH constituent in a respective samples. In the cases of where all PCB Aroclors or PAHs in a sample were reported as non-detect the maximum detection limit of the sample was used for the Total PCB or PAH Total concentration.

3.3.1 Zone 1

Polychlorinated Biphenyls

Thirty-two sediment samples were collected at 13 locations within Zone 1 and analyzed for PCBs by Method SW-8082. Aroclors 1242, 1248, and 1254 were detected within Zone 1. Total PCB detections within Zone 1 are presented in Figures 7.1−7.3. All PCB results are presented in Table 5.

Of the 32 samples collected within Zone 1 and analyzed for PCBs, 15 were nondetect, 3 were detected, but did not exceed the PEC screening level, and 13 exceeded the PEC screening level of 676 micrograms per kilogram (µg/kg). Samples with PEC exceedances represent 10 of the 12 locations sampled (SD21, SD024, SD026 through SD031, SD033, and SD035). The majority of the samples exceeding PEC criteria were two magnitudes of order greater than the PEC criteria of 676 µg/kg except for locations SD021 (4,000 J µg/kg at 0-0.5 ft), SD031 (3,500 µg/kg at 2-4 ft), SD033 (3,700 µg/kg at 0-0.5 ft) and SD035 (4,400 µg/kg at 0-0.5 ft).

The PEC exceedances of total PCBs most commonly occurred in the top 0.5 foot of the sediment cores, except at locations SD021, SD026, and SD031, where it also exceeded PEC at depths of 0 to 1.1 feet, 0 to 2 feet, and 0 to 4 feet, respectively.

3.3.2 Zone 2

Polychlorinated Biphenyls

Fifteen sediment samples were collected from eight locations within Zone 2 and analyzed for PCB Aroclors by Method SW-8082. Aroclors 1242 and 1248 were detected within Zone 2. Total PCB detections are presented in Figures 8.1−8.3. All PCB results are presented in Table 5.

The surface sample (0 to 0.5 foot) at SD048 was the only sample within Zone 2 to exceed the PEC screening level of 676 µg/kg. It was approximately two orders of magnitude greater than the PEC screening level.

Metals

Seventeen sediment samples were collected from nine locations within Zone 2, including SD021 from Zone 1, and analyzed for metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, manganese, nickel, selenium, silver, thallium, vanadium, zinc, and mercury) by Methods SW-6010B and

SW-7471. Metals detections exceeding sediment screening criteria are presented in Figures 9.1−9.3. All metals results are presented in Table 5.

Six of the 17 samples analyzed exceeded PEC screening levels of up to 5 different metals. Screening level exceedances occurred at locations SD021, SD036, SD048, and SD050. The PEC values that were exceeded include arsenic (33,000 µg/kg), cadmium (4,980 µg/kg), copper (149,000 µg/kg), lead (128,000 µg/kg), and zinc (459,000 µg/kg). Other metals that were detected but did not exceed the PEC screening level in Zone 2 include mercury, nickel, and silver.

The highest concentrations of metals were detected where Zone 1 and Zone 2 meet at South Hawley Street at core locations SD021, SD048, and SD050. Metals distribution with respect to sediment depth was evaluated. Metals concentrations were distributed throughout the surface and subsurface sediments.

Semivolatile Organic Compounds

Six sediment samples were collected from six locations within Zone 2 and analyzed for SVOCs by Method SW-8270. SVOC detections exceeding sediment screening criteria are presented in Figures 10.1−10.3. All SVOCs results are presented in Table 5.

None of the samples analyzed exceeded PEC screening levels for SVOCs. Other SVOCs that were detected but did not exceed the PEC screening level in Zone 2 include 2,4-dinitrotoluene, 3-methyphenol, 4-methyphenol, and bis-2-ethlhexyl]phthalate.

The highest concentrations of SVOCs were detected in the surface sediments at location SD048 just west of the South Hawley Street Bridge. Distribution of SVOCs with respect to sediment depth was evaluated. SVOCs concentrations were distributed throughout the surface and subsurface sediments, but were not detected below 1.3 feet.

Polycyclic Aromatic Hydrocarbons

Seventeen sediment samples were collected from nine locations within Zone 2, including SD021 from Zone 1, and analyzed for PAH-17 by Methods SW-8270 and SW-8270 SIM. PAH-17 detections exceeding sediment screening criteria are presented in Figures 11.1−11.3. All PAHs results are presented in Table 5.

Four of the 17 samples analyzed exceeded PEC screening levels of up to 10 different PAH-17 (including PAH, Total) at locations SD021, SD047, and SD050. The PAH-17 PEC values that were exceeded include anthracene (845 µg/kg), benzo[a]anthracene (1,050 µg/kg), benzo[a]pyrene (1,450 µg/kg), chrysene (1,290 µg/kg), fluoranthene (2,230 µg/kg), fluorine (536 µg/kg), naphthalene (561 µg/kg), phenanthrene (1,170 µg/kg), pyrene (1,520 µg/kg), and PAH, Total (22,300 µg/kg). Other SVOCs that were detected but did not exceed PEC screening levels in Zone 2 include 2-methylnapthlalene, acenaphthene, acenaphthylene, benzo[b]fluoranthene, benzo[g,h,i]perylene, benzo[k]flouranthene, dibenz[a,h] anthracene, and indeno[1,2,3-cd]pyrene.

PAH-17 distribution with sediment depth was evaluated for Zone 2, and no consistent trend was observed with regard to PAH-17 concentration with depth. The highest PAH concentrations were observed in both surface and subsurface sediments at SD021, SD047, and SD050.

Total Petroleum Hydrocarbon Diesel Range Organics and Oil Range Organics

Seventeen sediment samples were collected from nine locations within Zone 2, including SD021 from Zone 1, and analyzed for DRO and ORO by Method SW-8015C. All DRO and ORO detections are presented in Figures 12.1−12.3. All DRO and ORO results are presented in Table 5.

PEC criteria does not exist for DRO and ORO. The maximum DRO concentration was detected in the surface sediment at location SD021 (5,700,000 µg/kg), and the minimum concentration was detected in the surface sediment at location SD044 (28,000 µg/kg). The maximum ORO concentration was detected in the surface sediment at SD048 (6,100,000 J µg/kg), and the minimum concentration was detected in the surface sediment at location SD044 (33,000 µg/Kg).

Oil and Grease

Seventeen sediment samples were collected from nine locations within Zone 2, including SD021 from Zone 1, and analyzed for oil and grease by Method EPA-9071B. Oil and grease detections are presented in Figures 12.1−12.3. All oil and grease results are presented in Table 5.

No PEC criteria exists for oil and grease. The maximum oil and grease concentration was detected in the surface soil at location SD048 (1,400 µg/kg), and the minimum concentration was detected in the surface soil at location SD037 (110 J µg/kg).

3.3.3 Physical Parameters

Grain Size—Zones 1 and 2

Forty-seven sediment samples were collected from 26 locations within Swan Creek throughout both zones and analyzed for grain size by ASTM International Method D-442. In Zone 1 (including SD021), 32 samples were analyzed for grain size. In Zone 2, 15 samples were analyzed for grain size.

The grain size results are consistent with the visual observations made during sample collection activities. The sediment primarily consisted of gravel and sand, but some clayey silt was present near the mouth, and occasional silty sand occurred at various locations within the investigation area. Grain size sample results are presented in Table 5.

Total Organic Carbon—Zone 2

Sediment samples were collected from nine locations within Zone 2, including SD021 from Zone 1, and analyzed for TOC by the Lloyd Kahn Method. A total of 17 samples was analyzed throughout the zone.

TOC in sediment samples collected ranged from 0.307 to 5.84 milligrams per kilogram. TOC sample results are presented in Table 5.

4 Conclusions

Sediment thickness and water depth vary throughout Swan Creek, but generally show decreasing depths/thicknesses with increasing distance from the creek mouth. Water depth is shallow in the western portion of Zone 2. Gravel and sand were the dominant sediment types located within Swan Creek with some clayey silt located near the mouth and occasional silty sand at various locations within the investigation area. Visible sediment staining and evidence of contamination was observed near the transition between Zones 1 and 2 near the South Hawley Street Bridge in samples SD047 and SD021.

PCBs were detected at concentrations exceeding PECs at 10 of the 13 sample locations within Zone 1 and at one of the 8 sample locations within Zone 2. Metals were detected at concentrations exceeding PECs at 4 of the 9 sample locations, and PAH-17 were detected at concentrations exceeding PECs at 3 of the 9 samples locations within Zone 2, including SD021.

The three locations with PEC exceedances of metals and PAH-17 are located near the transition between Zones 1 and 2 at the South Hawley Street Bridge. One of those locations also includes the only PEC exceedance for PCBs in Zone 2.

Tables

TABLE 1

Summary of Deviations from the Field Sampling Plan

Swan Creek Phase 2, Maumee River Area of Concern

Location/Type of Deviation	Deviation from the FSP
Sampling Locations	Four sediment locations were not sampled as specified in the FSP due to the presence of debris in the creek that limited access to the portion of the river where sample locations SD038, SD039, SD040 and SD041 were located.
Core Sample Locations	Six sediment locations were not collected using the vibracore system due to shallowness of the river. The following locations were hand cored: SD036, SD037, SD042, SD043, SD044, and SD045)
Sample analyses	The total number of proposed samples to be collected was 90 (plus QA/QC and investigation-derived waste samples). The total number of samples collected was 48 (plus QA/QC). Most sample locations had less than 4 feet of sediment present for sampling, some locations did not provide any material suitable for sampling, and four sampling locations were inaccessible.
Collection of field duplicates and MS/MSD samples	Field duplicate and MS/MSD sample locations were modified from those specified in the FSP. The field duplicates and MS/MSDs were collected at locations with sufficient sediment volume. If field duplicates and MS/MSDs were planned for sample locations that could not be sampled, the QC samples were collected at other sample locations to ensure the field duplicate and MS/MSD frequency specified in the FSP was met. Table 3 presents the locations where field duplicate samples and MS/MSD samples were collected.
SD021	Due to visual observations of the sediment and the location of the sample, it was collected for the full analytical suite as inidcated in Zone 2.

FSP = field sampling plan

MS/MSD = matrix spike matrix spike duplicate

ft = feet

NS = Not Sampled

GPS = global positioning systems

Horizontal (XY) GPS data is reported in US Survey Feet, North American Datum 1983 State Plane Ohio.

NAVD88 = Elevation data referenced to North American Vertical Datum 1988 Geoid 09.

[a]The Ponar sampler was used to obtain extra sediment for the upper sampling interval of the vibracore samples.

[b]Total metals includes: antimony, arsenic, barium, berylluim, cadmium, chromium, copper, lead, manganese, mercury, nickel, selenium, silver, thallium, vanadium, and zinc.

-- = not applicable. Either the location was not sampled, or it was not analyzed for the selected parameter

MS/MSD = matrix spike/matrix spike duplicate

PAH-17 = polycyclic aromatic hydrocarbons - 17 list

Total PCB = polychlorinated biphenyl

NS = not sampled. The location was not sampled due to limited or no sediment unless otherwise noted on Table 2.

TOC = total organic Carbon

Zinc	459,000	121,000	µg/Kg

Only constituents with screening criteria are included on this table.

[a] MacDonald, D.D., Ingersoll, C.G., Berger, T.A. *Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosysten* of Environmental Contamination and Toxicology. January 2000.

[b] U.S. EPA Region 5, RCRA Ecological Screening Levels. August 2003.

µg/kg = micrograms per kilogram

-- = critera not available

PEC = probable effect concentrations

RSL = regional screening level

Appendix A
Affiliated Researcher's Data Summary Report

DATA SUMMARY REPORT

Sediment Sampling Services at Swan Creek
Phase 2, Maumee River AOC
Toledo, Ohio

GLAES Contract No. EP-R5-09-11
Submitted 16 July 2014
Final submitted 15 September 2014

This Data Summary Report (DSR) summarizes the methods and findings for services provided by AFFILIATED RESEARCHERS during the week of 1 June 2014, under sub-contract with CH2MHill with respect to the above referenced USEPA GLNPO site characterization project.

The Scope of Work (SOW) separated the project area (Figure 1) into two zones: (1) the lower 2 miles of Swan Creek from South Hawley St. overpass to the creek mouth; and (2) approximately 1.75 miles of Swan Creek from the South Hawley St. overpass to the fish passage project at Highland Park.

The overall objective of the project was to further characterize Swan Creek by means of the collection of additional chemical and physical information throughout the project defined reach. Specific objectives included:

- investigation of the extent of chemical contamination in surface sediments;
- evaluation of sediment thickness; and,
- provide information for the development of a feasibility study if one is found to be necessary.

The tasks performed to meet the described objective include the following:

- locating utilities;
- mobilization and demobilization;
- establishment of local control points and water level elevations;
- sediment sample collection using vibracore methods;
- sediment sample collection using manually driven core methods;
- sediment sample collection using ponar methods; and
- a draft and final data summary report.

AFFILIATED RESEARCHERS utilized its most suited equipment, software, and most experienced personnel (to include: Project Scientist, Health and Safety Manager, Staff Engineer, and 2 Technicians) to perform the described tasks.

This data summary report describes the activities conducted under each task, the reliability and accuracy of the data, problems encountered during the survey, and interpretation and any post-processing of the data. Scaled drawings representing results from the project, and both raw and interpreted data in electronic formats have also been provided.

Figure 1. Project Area.

LOCATING UTILITIES:

Prior to initiating intrusive subsurface activities, AFFILIATED RESEARCHERS contacted Ohio's *Locate 8-1-1*, and filed detailed descriptions of the proposed activities for the purpose of identifying and locating underground utilities within the project area. AFFILIATED RESEARCHERS ensured the locate "tickets" remained valid throughout the duration of the field work described within this SOW.

No problems were encountered with respect to the Utilities Locating aspect of the project.

MOBILIZATION/DEMOBILIZATION:

On 1 June 2014, AFFILIATED RESEARCHERS mobilized its crew, its currently registered vessels, and all supporting equipment, materials, and tools required to conduct the work described in the SOW. AFFILIATED RESEARCHERS mobilized one additional Technician in order to help expedite

the successful completion of the project, and thereby secure additional time for other scheduled GLNPO projects. The necessary staff, vessels, equipment, materials, and tools for the project were mobilized to the site prior to the first day of the field program, as scheduled by the CH2M HILL Field Team Leader. AFFILIATED RESEARCHERS demobilized its crew, vessels, and supporting equipment on 6 June 2014.

CH2M HILL had provided an electronic file of the horizontal sample location coordinates to AFFILIATED RESEARCHERS in advance of the start of the field effort. As part of the mobilization effort, AFFILIATED RESEARCHERS uploaded the project sample locations to its GPS equipment prior to beginning of sampling activities. CH2M HILL provided its staff to work at a shore-based staging location to log, process, document, package, and ship all sediment samples for laboratory analysis.

The nearest suitable boat launch facility for accessing the project was located at the selected staging area[1]; a facility owned by the City of Toledo approximately 0.7 miles from the mouth of Swan Creek.

No problems were encountered with respect to the Mobilization/Demobilization aspect of the project, with the exception of the existing condition of the staging area. A significant portion of the staging area, which was used for daily launching and landing of AFFILIATED RESEARCHERS' vessels, contained large amounts of hazardous obstructions (Figure 2) and was under construction during the time of the project. Precautionary measures were implemented for all tasks within this area by AFFILIATED RESEARCHERS' Health and Safety (HSE) Manager, to avoid accidents and injury.

Figure 2. Portion of staging area.

ESTABLISHMENT OF LOCAL CONTROL POINTS AND WATER LEVEL ELEVATIONS:

AFFILIATED RESEARCHERS provided its survey grade *Trimble R8* RTK-GNSS equipment operating in the real-time kinematic mode (RTK), and trained operators for same, to obtain highly accurate geodetic position and elevation data of the sediment sample locations.

On previous GLNPO projects at the Swan Creek site, AFFILIATED RESEARCHERS had located and confirmed 2 permanent local benchmarks (Table 1), to within accuracies described in the SOW. The permanent benchmark provided survey controls for positioning and surveying QAQC. The

[1] The project staging area was established at the City of Toledo Department of Streets, Bridges and Harbor Dock at 1030 Water Street, Toledo, Ohio.

accuracy of the RTK-GNSS equipment was confirmed twice daily at these local benchmarks. The GPS equipment QAQC checks are provided below in Table 2. USEPA GPS metadata forms were completed and provided to CH2MHill.

Due to the amount of urbanization surrounding the project site, AFFILIATED RESEARCHERS was not able to utilize its RTK-GPS "base station" as a means to provide radio-linked RTK corrections for the RTK-GPS equipment. As an acceptable alternative, the National Geodetic Survey (NGS) Continuously Operating Reference Station (CORS) network (managed by the Ohio Department of Transportation) was utilized to provide RTK corrections for the RTK-GPS equipment.

Table 2. GPS equipment QAQC checks at BM2.
(UTM Zone 17 North, NAD83 feet, NAVD88[2] Geoid 2012a feet).

[2] The NOAA website (http://www.ngs.noaa.gov/cgi-bin/IGLD85/IGLD85.prl) used to convert NAVD88 elevations to IGLD85 elevations, reported the project coordinates "Out of Bounds for Hydraulic Corrector model". However, when using nearby coordinates for the mouth of the Maumee River (Lake Erie), the conversion resulted in IGLD85 being 0.22' lower in elevation than NAVD88.

To account for fluctuations in water level elevations in Swan Creek (cause by wind driven seiche in Lake Erie), AFFILIATED RESEARCHERS utilized its RTK-GPS survey equipment to accurately measure and record water level elevations at the staging area, and at each sampling location.

No problems were encountered with respect to the establishment of local control points or water level elevations during the project.

FIELD RECORDS

AFFILIATED RESEARCHERS maintained daily written and electronic field records to be used in preparing the Data Summary Report. Written field records were maintained in a *Rite-in-the-Rain* notebook with *Rite-in-the-Rain* ink. Electronic field records were collected with data collectors and field computers, and "backed-up" at the end of field day to an onsite external hard drive.

Field records documented the following:

- datum, horizontal coordinates, vertical measurements, and elevations for each survey monument and benchmark;
- procedures, equipment, and personnel;
- calibration methods and measurements;
- QAQC;
- field conditions;
- river stage and water level measurements;
- planned and unplanned events;
- weather conditions; and,
- other important information.

SEDIMENT SAMPLE COLLECTION:

During 2 – 5 June 2014, AFFILIATED RESEARCHERS utilized its 20' vibracore vessel and equipment to collect discrete sediment samples, in 8' lengths of 3" diameter polycarbonate (i.e. *Lexan*) core-tubes, from designated locations at the site. CH2MHill provided personnel to be onboard AFFILIATED RESEARCHERS vibracore vessel, to complete data sheets and document the character and amount of the sediments collected (Figure 3).

Figure 3.

AFFILIATED RESEARCHERS' vibracore vessel consists of a 20' long pontoon vessel; 15' vertical tri-frame hoist; 40hp *Honda* 4-stoke outboard engine; and a 2' x 3' deck opening with a removable hatch cover. The vibracore vessel also include various other equipment items to

include sub-meter accurate GPS; *Raymarine* navigational GPS and depth sounder; 3.5kW generator; 600W GFCI-protected inverter; VHF marine radio; two anchoring spuds; and three *Danforth* anchors.

AFFILIATED RESEARCHERS utilized an industry proven *Rossfelder VT-1* underwater vibracore system for collecting vibracore sediment samples. The *Rossfelder VT-1* vibracore system includes a vibracore head which enables the vibrator to be fitted to 3" diameter polycarbonate core tubes. This vibracore system uses 115V and 12A, and operates at a power rating of 16kN. AFFILIATED RESEARCHERS followed its written *Standard Operating Procedures* for the collection of vibracore sediment samples.

Pre-determined sample locations were navigated to (within a 10' lateral distance as specified in the SOW) using the onboard RTK-GPS survey equipment. The actual sample locations upon which the vibracore vessel was established and the vibracore sample was collected, were surveyed to an accuracy of < 0.5' and recorded using the onboard RTK-GPS survey equipment (Table 3).

Prior to each vibracore sampling, a sediment thickness probing method was used to confirm the depth to the top and bottom of the accumulated soft sediments. AFFILIATED RESEARCHERS collected water elevations, spot bathymetry, and spot sediment thickness at each vibracore sampling location using its manual sounding pole and probing techniques.

To collect sediment thickness measurements using manual probing techniques, AFFILIATED RESEARCHERS utilized 1.25" diameter aluminum survey range-poles (in attachable 4' lengths) with an attached hardened point, as its manual push-probe. The survey range-poles have 1' incremental color measurements that are used for calculating depths of the accumulated sediments. The manual push-probe were manually pushed into the accumulated sediments by AFFILIATED RESEARCHERS' experienced Technician, until native substrates (i.e. bedrock, clay till, river gravel) are reached and/or poling "refusal" is determined. Using a surveyors ruler, AFFILIATED RESEARCHERS' Technician measured the water line at the nearest color-coded 1 foot increment on the push-probe to a 0.1' accuracy to obtain a depth of the sediment thickness.

A second survey range-pole, with a 6" diameter plastic disc attached in place of the hardened point, was used as a "sounding pole"[3] to obtain or confirm depth measurements of the top of the accumulated sediments (i.e. bathymetry). RTK-GPS survey equipment was used to obtain and record the position and water surface elevation at each sediment sampling location. The water depth was subtracted from the water level elevations obtained with the RTK-GPS in order to convert the depth measurements to bottom elevations. The water surface elevations at each sediment sample locations accurately accounted for fluctuations in water level elevations in Swan Creek.

AFFILIATED RESEARCHERS' manual probing techniques to obtain sediment thickness data have been specifically designed so as to penetrate only the "softer" sediment layers (i.e. silt, silty/sand,

[3] *Engineering and Design Hydrographic Surveying*. USCOE Manual 1110-2-1003. 2002 (amended 2004). Chapter 8. US Army Corps of Engineers. Washington DC.

organics, etc.) that have accumulated atop the native bed materials (coarse sand, gravel, rock, clay). AFFILIATED RESEARCHERS' manual probing techniques have been used several thousand times, and have been confirmed (i.e. compared against vibracore sampling data) as reliable on numerous GLNPO projects[4].

Data obtained from the sediment thickness probing method was used to estimate the amount of achievable sediment sample at each sample location, and to determine the percent recovery achieved during each vibracore sampling. Up to three attempts were made, if needed, within a 10' diameter area of the planned vibracore location to achieve satisfactory recovery. The percent recovery achieved at each sample location was calculated and recorded.

Manual coring methods were used as needed in both Zones 1 and 2 of the project area, where gravel-sandy type sediments or submerged debris resulting in limitations for the vibracore methods. AFFILIATED RESEARCHERS utilized the same 3" diameter cores tubes as used during the vibracore methods, and followed its written *Standard Operating Procedures* for the manual coring methods for collection sediment samples. CH2MHill provided its staff geologist to be onboard AFFILIATED RESEARCHERS vessel to conduct initial logging of sediment samples. Pre-determined sample locations were navigated to (within a 10' lateral distance as specified in the SOW) using the onboard RTK-GPS survey equipment. The actual location were the manual core sample was collected, was surveyed to an accuracy of < 0.5' and recorded using the onboard RTK-GPS survey equipment (Table 3).

Ponar sediment samples were collected in both Zones 1 and 2 of the project area, to provide addition volume of sediment material as needed. CH2MHill provided its staff geologist to be onboard AFFILIATED RESEARCHERS vessel to conduct initial logging of sediment samples. AFFILIATED RESEARCHERS followed its written *Standard Operating Procedures* for the collection of ponar sediment samples. Pre-determined sample locations were navigated to (within a 10' lateral distance as specified in the SOW) using the onboard RTK-GPS survey equipment. The actual location where the ponar sample was collected, was surveyed to an accuracy of < 0.5' and recorded using the onboard RTK-GPS survey equipment (Table 3).

AFFILIATED RESEARCHERS recorded the identification number, location, water elevation, water depth, and sediment thickness for each sediment sample (Table 3) and provided the information to the CH2MHill personnel. All sediment samples were labeled and logged by onboard CH2MHill personnel. AFFILIATED RESEARCHERS then delivered the samples to CH2MHill personnel at the staging area for processing (Figure 4).

AFFILIATED RESEARCHERS personnel utilized its 14' *Lund* aluminum vessel with a 10hp 4-stroke outboard motor, to shuttle samples to a boat dock located adjacent the *Toledo Farmer's Market* approximately 0.6 miles upstream of the mouth of Swan Creek. At this boat dock, the samples were transferred from the 14' vessel to another AFFILIATED RESEARCHERS' staff member who drove the samples (via vehicle) to CH2MHill personnel for processing at the staging area. All

[4] During 2011 at the Buffalo River, AFFILIATED RESEARCHERS' push-probe poling techniques were verified with "verification" vibracore samples conducted by ECOLOGY AND ENVIRONMENT and AQUA SURVEY.

core samples were maintained in a relatively upright orientation during all aspects of the transfer to the staging area.

The 20' pontoon vibracore vessel was able to be navigated, and utilized for collection of vibracore sediment samples throughout all of Zone 1, and approximately 0.5 miles into Zone 2. At approximately 0.5 miles upstream of the Hawley Street Bridge the water in the creek became too shallow to allow navigation of the 20' pontoon vessel. Due to these shallow water conditions, AFFILIATED RESEARCHERS utilized its 14' *Lund* aluminum vessel and manual coring methods on 6 June 2014 to collect sediment samples approximately ¾ mile further upstream than the pontoon vessel capabilities. A log jam a few hundred feet upstream of the Champion Street Bridge presented an impassable barrier for further upstream navigation with the 14' aluminum boat.

Figure 4.

CH2MHill personnel were able to access the creek by land at Highland Park (near the upstream end of the project area) and collect sediment samples at two locations. Manual coring methods and 3" diameter cores tubes were used during this procedure. The actual location where these samples were collected were surveyed to an accuracy of < 0.5' and recorded using the RTK-GPS survey equipment (Table 3).

Sediment samples were collected at a total of 26 of the 30 samples locations proposed in the SOW (Attachment 1). Three sample locations were inaccessible due log jams, and one sample location did not contain obtainable sediments for collection.

The project scope included the assumption that log jam barriers would not be a present within the project area; that the Ohio EPA and/or the City of Toledo would remove any log jams from the project area prior to start time of the project[5]. However, a total of 8 log jams were encountered within the creek during the project; 4 within Zone 1, and 4 within Zone 2 of the project area.

This first log jam encountered, which was also the largest and most hazardous log jam, was situated just downstream of the Summit Street Bridge; approximately 0.4 miles upstream of the mouth of the creek. This log jam had been created by a floating boom network within the creek, held in place by 4 separate ropes spanning the entire width of the creek. The boom was intended to capture falling debris from a nearby collapsing building however, the ropes spanning the width of the creek resulting in the capturing a significant mass of floating logs and woody debris. The ropes, and the mass of floating logs and woody debris presented an almost impassible barrier and a significant hazard to navigation. During the first day of the field operations, AFFILIATED RESEARCHERS' crew worked, using both its 20' and 14' vessels, for a total of approximately one

[5] Personal communications with Mr. Grant Koster, CH2MHill.

hour to successfully negotiate this barrier both upstream and downstream. This barrier was investigated by Mr. Mike Bryant of the USEPA, and reported to the Ohio EPA. AFFILIATED RESEARCHERS' HSE Manager determined that this barrier presented an unsafe and unacceptable condition to remain in place. During the second day of the field operations, AFFILIATED RESEARCHERS' crew worked, using both its 20' and 14' vessels, for approximately ½ hour to successfully remove and negotiate this barrier.

Table 3. Sediment sample coordinates and data.
(Coordinates are UTM Zone 17 North, NAD83 feet; water and bottom elevations are NAVD88[2] Geoid 2012a feet; probing depths and sediment thickness are feet).

Other log jams that presented significant barriers and hazards to navigation were noted downstream and upstream of the City Park Avenue Bridge; at the Norfolk Southern Railroad Bridge; and upstream of the Champion Street Bridge.

After the City of Toledo Department of Streets, Bridges, and Harbor Dock (City) was notified by AFFILIATED RESEARCHERS HSE Manager about the log jam downstream near the City Park Avenue Bridge, this barrier was removed by the City on 3 June during the project. This barrier had also been investigated by Mr. Bryant of the USEPA, who had stated that it was too massive for its removal to be attempted by AFFILIATED RESEARCHERS.

AFFILIATED RESEARCHERS was unable to negotiate upstream navigation, with its 14' aluminum boat, beyond the first of 4 log jams upstream of the Champion Street Bridge. Although suitable access was available at Highland Park to hand-launch the 14' aluminum boat, 3 log jams (the furthest upstream log jams within the project area) prevented downstream navigation from this location.

On 4 June, heavy rain and thunderstorms were forecasted and were closely watched on the local radar. Prevailing weather conditions were considered unsafe by AFFILIATED RESEARCHERS HSE Manager in accordance with AFFILIATED RESEARCHERS' SOP for Safe Boating and AHA, and vibracore operations (which involves 3.5kW of electricity and heavy overhead equipment) were halted at 11am to allow sufficient time to motor the boats to the staging area and the equipment be put away prior to the onset of the rains. The rains began at approximately 12:30pm and continued throughout the afternoon, during which time AFFILIATED RESEARCHERS conducted investigations of the upper reach of the project area and obtained additional supplies.

Data Usability Report

FINAL Data Usability Report
Swan Creek Phase 2 in the Maumee Area of Concern
EPA GLAES Contract
Task Order No. 0013/WP01/Contract No. EP-R5-11-09

PREPARED FOR: U.S. Environmental Protection Agency

PREPARED BY: CH2M HILL

DATE: October 10, 2014

Introduction

This report summarizes the quality evaluation of the data collected in June 2014 from the Swan Creek Phase 2 in the Maumee Area of Concern (AOC), Ohio. The investigation was conducted to report the chemical and physical characterization of soft sediments within the project area of Swan Creek to identify possible areas of focus for further evaluation and/or remediation in the Maumee AOC.

Field Data

Field investigation activities were conducted from June 1 through 6, 2014, in accordance with the field sampling plan (FSP; CH2M HILL 2014a) and quality assurance project plan (QAPP; CH2M HILL 2014b). The field data were assessed for completeness, compliance, and accuracy in accordance with the requirements stated in the QAPP. The deviations from the sampling program and potential impacts on the usability of the data and decision making are presented in the following subsections.

Global Positioning Systems

The positioning of the sampling vessel at the specified sample location with a high degree of accuracy was critical in meeting the data quality objectives of the project. A real-time kinematic (RTK) global positioning system (GPS) was used to position the vessel for sediment sampling. Additionally, water elevation, sediment surface elevation and descriptions of sediment samples were recorded on core logs for each location. Sampling and support vessels, as well as the GPS instrumentation for the sediment investigation, were provided by team subcontractor Affiliated Researchers. Horizontal GPS data were reported in Ohio State Plane Coordinates, referenced to the North American Datum of 1983. The elevations were referenced to the North American Vertical Datum of 1988. A daily GPS system check of the northing, easting, and elevation readings was performed against established benchmarks, and was performed both before and after sampling activities to verify horizontal and vertical accuracies. The information was recorded on EPA GLNPO Locational Data Checklist and Meta Forms to document the GPS system checks against project benchmark. The FSP stated that the acceptance criteria for horizontal and vertical accuracies would each be ±0.5 foot. The average horizontal and vertical accuracies at the GPS benchmark stations were well within the acceptance criteria at ±0.05 and ±0.03 foot, respectively.

A detailed description of the collection of GPS data, along with information regarding GPS deviations from the QAPP criteria, the metadata checklists, and deviations of sampling locations from the QAPP criteria are provided in the *Data Summary Report* (Affiliated Researchers 2014).

Sediment Sampling

Sediment sample collection and documentation activities, including photographing and logging the physical descriptions of the sediment core and grab samples, were conducted based on guidance outlined in the FSP and QAPP.

Sediment Core Collection

Forty-seven native sediment samples were collected from Zones 1 and 2 using vibracore methods. Zone 1 includes the lower 2 miles of Swan Creek from the South Hawley Street overpass to the creek mouth, and Zone 2 consists of about 1.75 miles from the South Hawley Street overpass to the fish passage project at Highland Park. The vibracore system was deployed from Affiliated Researchers' pontoon boat and used 3-inch-diameter polycarbonate vibracore tubes. Due to limited accessibility in Zone 2 caused by logjams or low water levels, cores from 6 of the 30 proposed sampling locations (SD036, SD037, SD042, SD043, SD044, and SD045) were collected using hand coring methods. Sampling locations SD038, SD039, SD040, and SD041 were completely inaccessible, and no samples were attempted/collected from these locations.

Each sediment core sample was proposed to be advanced to a maximum depth of 4 feet below the top of the soft sediment. If needed, up to three locations within a 10-foot-diameter area of the original location were to be attempted to achieve acceptable recovery. Modifications to seven of the locations proposed in the FSP were made in the field based on the conditions encountered (SD023, SD025, SD034, SD042, SD043, SD046, and SD049). At several locations, sediment samples could not be collected even after three attempts because of gravel or debris present on the surface of the creek bed. When no suitable material for sampling was encountered at the original or step-out locations, reconnaissance of the area approximately 100 feet upstream and downstream from bank to bank of the original location was conducted to identify a representative sample location. In some cases, there was not enough sediment present above the gravel or debris to conduct coring, but a sufficient thickness of sediment was present for a sample to be collected using a ponar sampler (SD023 and SD049). The sampling locations, or attempted sampling locations were surveyed with a Trimble R6 RTK-GPS.

In order to ensure that enough sediment volume was collected for characterizing the shallow interval (0.0 foot to 0.5 foot) at each location, ponar grabs were taken at each of the vibracore locations. In instances where hand core methods were used, a duplicate core was collected.

The sediment cores and ponar samples were processed onshore per the guidance outlined in the FSP and QAPP.

Laboratory Data

The sediment investigation was conducted from June 2 through 6, 2014. Analytical method information is presented in Table 1. Samples were collected and shipped to ALS Laboratories for the following analyses:

- Forty-seven samples were analyzed for grain size, polychlorinated biphenyls (PCB) Aroclors, and percent moisture.
- Seventeen sediment samples (except where noted) were analyzed for the following parameters: list of 17 polycyclic aromatic hydrocarbons (PAH-17), mercury, metals, diesel range organics (DRO), oil range organics (ORO), oil and grease, total organic carbon (TOC)
- Six samples were analyzed for semivolatile organic compounds (SVOC).
- Three field duplicates were analyzed for grain size, PCB Aroclors, and percent moisture.
- Three field splits were analyzed for grain size, PCB Aroclors, and percent moisture.
- One field duplicate was analyzed for the following parameters: SVOCs, PAH-17, mercury, metals, DRO, ORO, oil and grease, and TOC.

- One field split was analyzed for the following parameters: SVOCs, PAH-17, mercury, metals, DRO, ORO, oil and grease, and TOC
- One equipment blank was collected during sampling to evaluate field sampling and decontamination procedures.

Quality assurance (QA)/quality control (QC) samples were collected at the frequencies indicated in the FSP and QAPP (CH2M HILL 2014a and b). QA/QC samples included the following: field duplicates, matrix spikes (MSs)/matrix spike duplicates (MSDs), and equipment blanks. Field duplicate, field split, and MS/MSD samples were collected at a minimum frequency of 5 percent. In accordance with the FSP, MS/MSD samples were not collected for percent moisture and grain size.

Individual method requirements and guidelines from the QAPP (CH2M HILL 2014b), elements of *Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review* (EPA 2008), and *Contract Laboratory Program National Functional Guidelines (NFG) for Inorganic Superfund Data Review* (EPA 2010) were used in this assessment.

ALS Laboratories' data were checked for completeness and compliance by CH2M HILL. ALS Laboratories' results for geotechnical parameters were 100 percent reviewed and verified by CH2M HILL, as stated in the QAPP (CH2M HILL 2014b). At the direction of the Great Lakes National Program Office as stated in the QAPP (CH2M HILL 2014b), a third-party validator conducted an independent review of CH2M HILL's validated data set.

Eighty percent of the analytical data were reviewed by Critigen following the Stage 2A validation level, and 20 percent at Stage 2B, according to the *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use (*EPA 2009). Stage 2A validation was completed on sample delivery groups (SDGs) 1406247 and 1406411, and Stage 2B validation was completed on SDG 1406337. Validation was performed in accordance with the QAPP and patterned after the EPA NFGs flagging protocol. The QC requirements specified in the QAPP, individual analytical method requirements, and laboratory standard operating procedures were referenced during the review of the data set. Data were qualified according to the measurement quality objectives specified in the QAPP for each parameter.

As mentioned previously, Stage 2B validation was conducted on 20 percent of the data by Critigen. Qualifiers that were applied during the automated completeness and compliance checks were adjusted, as

appropriate, as a result of this higher-level review and are detailed in the validation narrative reports provided in Attachment 1.

Data qualifiers were applied to sample results when the QC statistics indicated a possible bias to specific compounds or analytes associated with a particular method and sample batch. Standard data qualifiers were used as a means of classifying the data with regard to their conformance to QC requirements. The applied data qualifiers are defined as follows:

Qualifier	Definition
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
J	The analyte was positively identified; the associated numerical value is an approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the action limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The sample result was rejected because of serious deficiencies in the ability to analyze the sample and meet the QC criteria. The presence or absence of the analyte could not be verified.

The validation narratives and worksheets indicate which of the sample results were biased as a result of applicable QC statistics or other NFG requirements. The findings of the reviews are summarized in the following sections.

Findings

The following subsections summarize the data validation findings and usability of the final reportable results.

TOC Data

TOC data were assessed for 17 native sediment samples collected at 9 locations. The data validation summary indicates the following:

- None of the reported TOC results was rejected.

One-hundred percent of the TOC data, as qualified, can be used to make project decisions.

PCB Aroclor Data

PCB Aroclor data were assessed for 47 native sediment samples collected at 26 locations. The data validation summary indicates the following:

- UJ qualifiers were applied to sample results that were potentially affected by continuing calibration standard deficiencies.
- J qualifiers were applied to sample results that were affected by continuing calibration acceptance criteria deficiencies or disagreement of quantitation between the primary and secondary analytical columns.
- None of the reported PCB Aroclor results was rejected.

One-hundred percent of the PCB Aroclor data, as qualified, can be used to make project decisions.

SVOC Data

SVOC data were assessed for six native sediment samples collected at six locations. The data validation summary indicates the following:

- UJ qualifiers were applied to sample results that were potentially affected by low laboratory control sample spike recovery, continuing calibration standard acceptance criteria deficiencies, or relative response factors values below those listed in laboratory standard operating procedure.
- J qualifiers were applied to sample results surrogate spike recoveries outside laboratory control limits.
- None of the reported SVOC results was rejected.

One-hundred percent of the SVOC data, as qualified, can be used to make project decisions.

PAH-17

PAH-17 data were assessed for 17 native sediment samples collected at 9 locations. The data validation summary indicates the following:

- J qualifiers were applied to sample results that were affected by surrogate spike recovery outside of laboratory control limits.
- None of the reported PAH-17 results was rejected.

One-hundred percent of the PAH-17 data, as qualified, can be used to make project decisions.

Total Mercury

Total mercury data were assessed for 17 native sediment samples collected at 9 locations. The data validation summary indicates the following:

- J qualifiers were applied to sample results that were reported between the method detection limit and the reporting limit.
- None of the reported total mercury results was rejected.

One-hundred percent of the total mercury data, as qualified, can be used to make project decisions.

Total Metals

Total metals data were assessed for 17 native sediment samples collected at 9 locations. The data validation summary indicates the following:

- U qualifiers were applied to sample results at trace concentrations that were also found in the associated initial calibration blank, continuing calibration blank, and method blank.
- J qualifiers were applied to sample results that were reported between the method detection limit and the reporting limit.
- J qualifiers were applied to sample results affected by continuing calibration verification standard results outside acceptance criteria.
- None of the reported total metals results was rejected.

One-hundred percent of the total metals data, as qualified, can be used to make project decisions.

Diesel Range Organics Data

DRO data were assessed for 17 native sediment samples collected at 9 locations. The data validation summary indicates the following:

- J qualifiers were applied to sample results that were affected by surrogate spike recoveries outside criteria and field duplicate precision.
- None of the reported DRO results was rejected.

One-hundred percent of the DRO data, as qualified, can be used to make project decisions.

Oil Range Organics Data

ORO congener data were assessed for 17 native sediment samples collected at 9 locations. The data validation summary indicates the following:

- J qualifiers were applied to sample results that were affected by surrogate spike recoveries outside criteria and field duplicate precision.
- None of the reported ORO results was rejected.

One-hundred percent of the ORO data, as qualified, can be used to make project decisions.

Oil and Grease Data

Oil and grease data were assessed for 17 native sediment samples collected at 9 locations. The data validation summary indicates the following:

- None of the reported oil and grease results was rejected.

One-hundred percent of the oil and grease data, as qualified, can be used to make project decisions.

Geotechnical Parameters

Geotechnical data results for grain size were evaluated for completeness and compliance in the Stage 2A validation. A total of 47 geotechnical samples was collected from 26 locations. The reported grain size data were determined to be in compliance with the method as delivered from the laboratory.

All of the grain size data can be used in the decision making process.

Independent Validation

The sediment data set and one water sample were reviewed by EPA's third-party validators, CB&I Federal Services, Inc. (CB&I), Quality Assurance Technical Support Program, to assess the accuracy and precision of the method and the matrix using the appropriate criteria established in the NFG and QAPP and to verify that the data set was complete. CB&I completed a Tier 2 validation after initial validation by CH2M HILL. Attachment 2 contains the Release of Validated Data Report prepared by CB&I during data review.

CH2M HILL incorporated the CB&I findings into the final data set reported. Attachment 3 contains the final analytical data tables, as well as the final qualifiers, that resulted from the merged Critigen and CB&I validation process.

Conclusions

The goal of the data assessment is to determine if deviations from the FSP and QAPP affect the usability of the field data collected and the analytical results, and to determine whether the field and laboratory data can be used to support the decision making process. The following summary highlights the data evaluation findings:

1. The reduced number of samples collected at the site because of minimal or no sediment provides information regarding the distribution / location of sediment deposits, and did not adversely affect the data usability. The data provided on the quantity and distribution of sediment deposits within the investigation area can be used for future scope development of additional investigations or remedial actions.
2. The reduced number of samples due to accessibility issues in the field did not impact the data quality or usability of the samples collected during this investigation. The inaccessibility of sample locations did however, did create a data gap in Zone 2 that should be considered if conducting additional investigation.
3. Changes to the proposed sediment sampling location provided a representative sample where sediments were present, and did not adversely affect the data usability.

4. The GPS average horizontal and vertical accuracies of ±0.05 foot and ±0.03 foot, respectively are acceptable for the purposes of this investigation.
5. The completeness objective of 90 percent was met for all method/analyte combinations, and 100 percent of the analytical data can be used to make project decisions.
6. The precision and accuracy of the data, as measured by field and laboratory QC indicators, indicate that the data quality objectives were met.
7. No analytical data from the Swan Creek project were rejected as a result of the validation process.

Data Quality Evaluation

Data Quality Evaluation for GLNPO Swan Creek, June 2014 Sampling Event

Introduction

This data quality evaluation (DQE) report assesses the quality of analytical results for sediment samples collected at Swan Creek in the Maumee River Area of Concern located in Toledo, Ohio. CH2M HILL collected samples June 2-6, 2014. Guidance for this DQE report came from the *Final Quality Assurance Project Plan, Assessment of Contaminated Sediment in Swan Creek Phase 2 in the Maumee Area of Concern, April 2014,* CH2M HILL and individual method requirements. The analytical results were evaluated using the criteria of precision, accuracy, representativeness, comparability, and completeness (PARCC) as described in the United States Enviornmental Protection Agency (USEPA) guidance documents.

This report is intended as a general data quality assessment designed to summarize data issues. This DQE assesses the quality of the analytical results for all samples submitted in batches along with the Swan Creek investigation samples.

Analytical Data

This DQE report covers 48 normal investigative (N), 6 field duplicate (FD), and 1 equipment blank samples. The samples were reported in three sample delivery groups (SDG) listed as 1406247, 1406337, and 1406411. Samples were collected and delivered to ALS Environmental in Holland, Michigan. Analyses were performed at ALS in Holland, Michigan and ALS in Kelso, Washington. The samples were analyzed by one or more methods listed in Table 1.

TABLE 1
Analytical Parameters
GLNPO Swan Creek, June 2014

Parameter	Method	Laboratory
Semi-volatile Organic Compounds (SVOCs)	SW8270D	ALS - Holland
Semi-volatile Organic Compounds / PAHs – Low Level	SW8270M	ALS - Holland
TPH Diesel/Oil Range Organics	SW8015M	ALS - Holland
PCB Aroclors	SW8082	ALS – Holland
Metals	SW6020A	ALS – Holland
Mercury	SW7471 / SW7470A	ALS – Holland
Total Organic Carbon (TOC)	Lloyd Kahn / SW9060	ALS – Holland
Oil and Grease	E1664A / SW9071B	ALS – Holland
Moisture	A2540G	ALS – Holland
Grain Size	D422	ALS - Kelso

Data validation was performed at the Stage 2a level in accordance with the EPA Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use, January 2009, for 100% of the data; and data validation at the Stage 2b level was performed on up to 20% of the data (by SDG).

Stage 2a includes the following:

- Chain-of-Custody
- Case Narrative
- Field and Sample ID's
- Holding Time
- Preservation and Cooler Temperature
- Method Blank (Preparation Blank)
- Field Blanks
- Matrix Spike/Matrix Spike Duplicate
- Sample Duplicate (Metals)
- Field Duplicates
- Serial Dilution Sample (Metals)
- Laboratory Control Sample
- Surrogate (DMC) Recovery (Organics)
- Percent Solids (if applicable)

Stage 2b includes the following:

- Consists of all of the items in Stage 2a validation plus:
- Tune
- Initial Calibration
- Initial and Continuing Calibration Verification
- Initial and Continuing Calibration Blanks (Metals)
- Internal Standards
- Target Compound Identification (Organics)
- Interference Check Standards (Metals)

Following this guidance, SDGs 1406247 and 1406411 underwent Stage 2a validation and SDG 1406337 underwent Stage 2b validation.

Data flags were assigned according to the QAPP. Multiple flags are routinely applied to specific sample method/matrix/analyte combinations, but there will only be one final flag. A final flag is applied to the data and is the most conservative of the applied validation flags. The final flag also includes matrix and blank sample effects.

The data flags are those listed in the QAPP and are defined below:

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

R = The sample result was rejected because of serious deficiencies in the ability to analyze the sample and meet the QC criteria. The presence or absence of the analyte could not be verified.

U = The analyte was analyzed for but was not detected above the reported sample quantitation limit.

UJ = The analyte was not detected above the reported sample quantitation limit; however, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Samples

The samples evaluated are listed in Table 2 below.

FD = Field Duplicate Sample
EB = Equipment Blank
SED = Sediment

Findings

The overall summaries of the data validation are contained in the following sections and in Table 3 at the end of this attachment.

Holding Time and Preservation

All samples were analyzed within the USEPA recommended holding times.

Method Blanks

Method blanks were analyzed at the required frequency and were generally free of contamination. Chromium, manganese, nickel, bis(2-ethylhexyl)phthalate, and acenapthene were detected in method blanks below the reporting limit. When the analyte detected in the blank was also detected in an associated sample, the data were evaluated according to the QAPP. Table 3 includes a single chromium result that was affected by blank contamination, qualified as nondetect, flagged "U", and identified as "LBL" in the "Reason Code" column. Of the total data reported, less than 0.1% of the data (1 of 2568 total records) were qualified as non-detects due to blank contamination. These blank

related contamination results are within acceptable limits of the QAPP and are typical for this type and size of investigation.

Equipment Blanks

A single equipment blank was collected during this event, EB001. Lead, beryllium, copper, nickel, cobalt, thallium, barium, manganese, zinc, TOC, oil and grease, and caprolactam were detected in the equipment blank below the RL. When the analyte detected in the blank was also detected in an associated sample, the data were evaluated according to the QAPP. All associated sample results were either non-detects or were greater than 5x the concentration in the equipment blank. No qualification of data was necessary.

Laboratory Control Samples

Laboratory control samples (LCS) were analyzed as required. A single LCS sample had several compounds recovered out of criteria; however, this LCS was only associated with the equipment blank sample. No qualification of data was necessary.

Matrix Spike and Matrix Spike Duplicate Samples

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples were performed as required by the analytical method. The majority of recoveries were within laboratory established QC limits. When recoveries were low, the MS/MSD parent sample result was qualified as estimated, "J" or "UJ". When recoveries or RPD were high, MS/MSD parent sample detected results only were qualified as estimated, "J". Non-detects were not qualified. Overall, 21 results (less than 1% of total results) were qualified as estimated due to MS/MSD exceedances. These results are typical for this type of matrix and size of investigation.

Surrogates

Surrogates were added as required and all acceptance criteria were met, with the following exceptions:

- Several samples had a single SVOC surrogate recovered out of criteria. No qualification of data is necessary unless 2 or more surrogates from a fraction are out of criteria. No flags were applied.
- Sample SC14-SD021-0.0/0.5 had high surrogate recovery for PCBs analysis and four samples, SC14-SD048-0.0/0.5, SC14-SD048-0.0/0.5R, SC14-SD048-0.5/1.5, and SC14-SD050-0.5/1.7 had high surrogate recovery for DRO and ORO analysis. Associated detected results were qualified as estimated, "J", with a "Reason Code" of "SSH". Non-detected results were not qualified.

Overall, 0.4% of results (10 out of 2568 total results) were qualified as estimated due to high surrogate recovery.

Field Duplicate Samples

Six Field Duplicate samples were collected and analyzed. The following field duplicate sets were collected:

- SC14-SD022-0.0/0.5 / SC14-SD022-0.0/0.5D
- SC14-SD023-0.0/0.5 / SC14-SD023-0.0/0.5R
- SC14-SD027-0.5/2.0 / SC14-SD027-0.5/2.0D
- SC14-SD030-0.5/2.0 / SC14-SD030-0.5/2.0R
- SC14-SD048-0.0/0.5 / SC14-SD048-0.0/0.5R
- SC14-SD044-0.5/1.8 / SC14-SD044-0.5/1.8D

Several field duplicate pairs did not meet precision criteria for one or more compounds, as noted below:

- SC14-SD027-0.5/2.0 / SC14-SD027-0.5/2.0D did not meet precision criteria for Aroclor 1242 and total PCBs.
- SC14-SD030-0.5/2.0 / SC14-SD030-0.5/2.0R did not meet precision criteria for Aroclor 1254 and total PCBs.
- SC14-SD044-0.5/1.8 / SC14-SD044-0.5/1.8D did not meet precision criteria for barium, lead, manganese, vanadium, and zinc.
- SC14-SD048-0.0/0.5 / SC14-SD048-0.0/0.5R did not meet precision criteria for mercury, DRO, caprolactam, acenaphthene, acenaphthylene, and dibenz(a,h)anthracene.

These results were qualified as estimated, "J" or "UJ", in the field duplicate pairs, and are presented in Table 3. Overall, 30 results out of 659 normal and field duplicate results (less than 5%) were qualified as estimated due to field duplicate precision exceedances. With the sediment sample matrix, these results were well within expected precision results.

Calibration

Calibration data were reviewed and met method criteria routinely for the majority of target analytes. In several SVOC initial calibration verification analyses, one or more analytes were recovered outside of QC criteria. Table 3 at the end of the appendix shows 12 results qualified as estimated, "J" or "UJ", and identified as "ICVL" in the "Reason Code" Column due to low %D for those compounds. Of the total data reported, 0.5% of the data (12 of 2568 total records) were qualified as estimated due to calibration exceedances. These results are within acceptable limits of the QAPP and are typical for this type and size of investigation.

Internal Standards

Internal standards data were reviewed and met method criteria routinely for the majority of samples. However, several samples did have internal standards recovered out of criteria. Two samples had high internal standard recovery, but all associated compounds were non-detects. In these instances, no data qualification was necessary. Five samples had low internal standard recovery for SVOC analysis. All associated results for these samples were qualified as estimated, "J" or "UJ" and are presented in Table 3 with a Reason Code of "ISL". Of the total data reported, 1.5% of the data (3 of 2568 total records) were qualified as estimated due to internal standard exceedances.

Chain-of-Custody

Required procedures were followed with the following exceptions being noted:

- Lab Sample Receipt for SDG 1406411 indicated that for sample EB001, the matrix was marked as sediment instead of water. This had no effect on analysis or data reporting. No data qualification was necessary.
- Lab Sample Receipt for SDG 1406411 indicated that sample SC14-SD036-0.5/2.0 had an MS/MSD marked for grain size and TOC analysis, but no extra sample containers had been included. As per communication from CH2M HILL, MS/MSD analysis was not needed for these analyses.
- Lab Sample Receipt for SDG 1406247 indicated that sample SC14-SD0289-0.0/0.5 had an MS/MSD marked for grain size and TOC analysis, but no extra sample containers had been included. As per communication from CH2M HILL, MS/MSD analysis was not needed for these analyses.
- Lab Sample Receipt for SDG 1406337 indicated that sample SC14-SD049-0.0/0.5 had an MS/MSD marked for grain size and TOC analysis, but no extra sample containers had been included. As per communication from CH2M HILL, MS/MSD analysis was not needed for these analyses.

Overall Assessment

The goal of this assessment is to demonstrate that a sufficient number of representative samples were collected and the resulting analytical data can be used to support the decision making process. The following summary highlights the PARCC findings for the above-defined event:

- Precision of the data was verified through the review of the laboratory data quality indicators that include MS/MSD and FD relative percent differences (RPDs). Precision was acceptable for all analyses with the exception of several field duplicate and MS/MSD results that were discussed above. All other precision criteria were met. Appropriate data qualifiers were applied.

- Accuracy of the data was verified through the review of the calibration, LCS, MS/MSD, and surrogate recoveries, as well as the evaluation of method/field blank data. Accuracy was acceptable for most analyses with the exception of several LCS, surrogate, calibration, and MS/MSD results that were discussed above. All other precision criteria were met. Appropriate data qualifiers were applied.

- Representativeness of the data was verified through the samples' collection, storage, and preservation procedures and the verification of holding-time compliance. The laboratory did not note any problems with the samples' collection, holding-time, and storage and preservation procedures that affected the ability to use the data.

- Comparability of the data was ensured through the use of standard analytical procedures and standard units for reporting. Results obtained are comparable to industry standards in that the collection and analytical techniques followed approved, documented procedures.

- Completeness is a measure of the number of valid measurements obtained in relation to the total number of measurements planned. Completeness is expressed as the percentage of valid or

usable measurements compared to planned measurements. Valid data are defined as all data that are not rejected for project use. All data are considered valid.

Notes:

FD = Field duplicate RPD exceeded precision criteria

ICVL = Compound had low %D in initial calibration verification sample

ISL = Internal standard had low recovery

LBL = Compound detected in associated laboratory method blank below the RL

LD = Laboratory Duplicate %D exceeded precision criteria

MSDH = Compound had high %R in matrix spike duplicate sample

MSDL = Compound had low %R in matrix spike duplicate sample

MSDP = Compound RPD exceeded MS/MSD precision criteria

MSH = Compound had high %R in matrix spike sample

MSL = Compound had low %R in matrix spike sample

SSH = Surrogate had high recovery

Dear Mr. Loomis:

EPA CONTRACT NUMBER EP-W-10-033
TASK ORDER NUMBER 3025
DATA VALIDATION SUPPORT

Enclosed please find the Release of Validated Data Report for the validation of Aroclor, Metals, Mercury, Oil and Grease, Total Organic Carbon (TOC), Diesel Range Organics (DRO)/Oil Range Organics (ORO), Semivolatile, Semivolatile SIM, and Geotechnical Methods sediment sample data for the Swan Creek Phase 2 in the Maumee Area of Concern site analyzed by ALS Group USA, Corp. in Holland, Michigan and Kelso, Washington. This report is a deliverable under Task 3 of the subject Task Order.

If you have any questions, please feel free to contact me.

Sincerely,

Shellee McGrath

RELEASE OF VALIDATED DATA

DATE: September 25, 2014

SUBJECT: Review of Data for the Swan Creek Phase 2 in the Maumee Area of Concern Site
Received for Review: September 09, 2014, September 17, 2014, and September 23, 2014

LABORATORY: ALS Group USA, Corp., Holland, Michigan
ALS Group USA, Corp., Kelso, Washington

FROM: Shellee McGrath, CB&I Federal Services LLC
Quality Assurance Technical Support (QATS) Program, Las Vegas, NV

TO: Mark Loomis, Great Lakes National Program Office (GLNPO)

LEVEL OF REVIEW: Tier 2 Validation Review

QATS has completed review of the validated data for the following project:

SITE Name: Swan Creek Phase 2 in the Maumee Area of Concern Site

Contractor: CH2M Hill, Dayton, OH

Primary Validators: CH2M Hill, Dayton, OH

SDG Numbers: 1406247, 1406337, and 1406411

Analytical Methods: Semivolatile (SW-846 8270), Semivolatile-SIM (SW-846 8270-SIM), Aroclor (SW-846 8082A), Metals (SW-846 6020C) and Mercury (SW-846 7471B and 7470A), Total Organic Carbon (TOC) (Lloyd Khan), Oil and Grease (SW-846 9071A), Diesel Range Organics (DRO)/Oil Range Organics (ORO) (SW-846 8015C), and Particle Size (ASTM D422)

Number and Type of Samples: 54 Sediment Samples and 1 Water Sample

VALIDATION SUMMARY

This report summarizes the data verification of previously validated analytical results from samples from the Swan Creek Phase 2 in the Maumee Area of Concern Site, in support of EPA's Great Lakes National Program Office (GLNPO). This evaluation and preparation of this report was performed by CB&I's Quality Assurance Technical Support Program (QATS) under Technical Direction 24, Task Orders 2125 and 3025.

Fifty-four (54) sediment samples and one water sample (rinsate blank) in three SDGs (SDGs 1406247, 1406337, and 1406411) were collected by CH2M Hill from Swan Creek Phase 2 Maumee Area of Concern Site locations between June 02, 2014 and June 06, 2014, and shipped to ALS Group USA, Corp. in Holland, Michigan for analysis. The ALS Holland Michigan laboratory subsequently shipped the sediment samples designated for Total Organic Carbon (TOC) and Particle Size to the ALS Laboratory in Kelso, Washington.

The initial data validation was performed by CH2M Hill in Dayton, Ohio. Tier 1 and 2 validation was performed on all samples, sample-related QC, and instrument-related QC as listed in the Assessment of Contaminated Sediment in Swan Creek Phase 2 in the Maumee Area of Concern Quality Assurance Project Plan (QAPP). The National Functional Guidelines for Superfund Organic Methods Data Review, June 2008, and the National Functional Guidelines for Superfund Inorganic Methods Data Review, January 2010 were the guidance documents used by CH2M Hill in the original validation and by QATS in the subsequent validation/verification.

At the direction of EPA, CH2M Hill provided the validated data and an Electronic Data Deliverable (EDD) file to QATS via the CH2M Hill Extranet System on September 09, 2014 for the data validation/verification checks. Missing CCV raw data for the Aroclor Fraction and confirmation of a possible sample ID discrepancy (see following paragraph) were requested by QATS on September 17, 2014. A pdf file was received at QATS via e-mail on September 17, 2014 containing the missing CCV data. The laboratory confirmed the sample ID mix-up and provided a revised data package and EDD file on September 19, 2014. The EDD file received was not in the same format as the EDD files containing the CH2M Hill qualifiers; however, CH2M Hill provided the correct EDD format upon request on September 23, 2014. QATS conducted a Tier 2 validation (without the full validation reports) on the three SDGs using the Tier 2 Validation Worksheets developed by QATS specifically for GLNPO validation. The resulting QATS qualifiers were compared to the CH2M Hill-applied qualifiers and verified in the EDD files included with the data submission. The following issues were identified:

- For the Particle Size fraction in SDG 1406247, the original validators qualified the result for Clay (0.005 mm); Sand, Fine; Sand, Very Fine; and Silt with a J qualifier due to failed laboratory duplicate RPDs. However, these RPD failures appear to be due to a sample labeling discrepancy for the sample duplicate. The samples were assigned a Kelso laboratory sample ID upon arrival at the Washington laboratory. The report forms generated by the laboratory used the ALS Holland laboratory ID as the client ID. The correct Holland ID of 1406247-11A was assigned to Kelso sample K1405710-32; however, Kelso sample K1405710-32dup was assigned to a sample with the Holland Lab ID of 1406247-27A. As a result, the duplicate sample for 1406247-11A was compared to the original sample for 1406247-27A, which resulted in the RPD failure and the qualification of sample SC14-SD032-2.0/4.0 (1406247-27A) for Clay (0.005mm); Sand, Fine; Sand, Very Fine; and Silt. When the duplicate sample is compared to the original sample with the same Kelso sample ID, all RPDs are within

limits. Also note that 1406247-11A was identified as QC on Chain-of-Custody (COC). The duplicate sample in the EDD is incorrectly labeled 1406247-27A. QATS validators requested confirmation from the laboratory, and a revised EDD file was subsequently received. The J qualifiers were removed in the EDD file.

- For the metals fraction, the QATS validator observed the original sample results reported on the FORM V (Matrix Spike/Matrix Spike Duplicate Recovery) did not match the results reported on the corresponding FORM I (Inorganic Analysis Data Sheet). Upon further review, it was discovered that the results on the FORM V were not corrected for percent solids and were not reported in the same units as listed on the FORM I; however, the percent recoveries were not affected. No data needed to be qualified for this discrepancy.

- Also in the metals fraction, the QATS validator observed several continuing calibration verification (CCV) failures had occurred throughout the analytical sequences. The samples in these SDGs were bracketed by compliant CCVs with the exception of beryllium in three samples in SDG 1406337. Also, no Serial Dilution analyses were performed with the Swan Creek samples. Beryllium in three samples were qualified J, no qualifiers were assigned for the absence of a serial dilution.

- For the PAH-SIM fraction, there were several different sets of surrogate acceptance limits listed throughout the data package. One set of limits were reported on the Form 2D (Soil Semivolatile Surrogate Recovery); a different set of limits (for three of the five surrogates) were reported with each sample on the Level 2 Report Summary Forms; and the sample raw data contained another recovery range. Note that none of the three different surrogate acceptance limits match the criteria listed in the laboratory's SOP. The Assessment of Contaminated Sediment in Swan Creek Phase 2 in the Maumee Area of Concern QAPP states that QC requirements are as specified in the analytical methods, laboratory SOWs, and laboratory SOPs; therefore, the QATS validator used the acceptance criteria listed in the laboratory SOP for qualification purposes.

- CH2M Hill qualified analyte results for field duplicates and original samples when the RPD was outside of the acceptance limits (50%). As a general GLNPO rule, sample results are not qualified by QATS due to field duplicate RPD unless the RPD exceeds 100%. The RPDs greater than 50% are listed in the Validation Narrative. As a result, 14 J qualifiers were removed.

- Table 1 in the Draft Swan Creek Data Quality Evaluation report listed ALS – Holland as the laboratory that performed the Total Organic Carbon (TOC) analysis. The TOC analysis for the sediment samples was performed by the ALS – Kelso laboratory. ALS – Holland performed TOC analysis for the Equipment Blank only.

- Table 2 lists one sample as SD14-SD050-0.5/0.5. This sample is listed as SD14-SD050-0.0/0.5 on the COC record. The QATS validator determined the laboratory assigned the incorrect EPA Sample ID to this sample. Note that the correct sample ID appears in the "Sample ID" column of the EDD; however, the sample ID is incorrect in the "Sample Name" column.

- The Field Duplicate Section of the Draft Swan Creek Data Quality Evaluation report lists sample SC14-SD044-0.5/1.8D as the field duplicate of sample SC14-SD044-0.5/1.8. However,

sample SC14-SD044-0.5/1.8 is reported as SC14-SD044-0.5/1.3 on the COC record, Table 2, laboratory data, and the EDD file.

Data validation and verification were performed on 2,819 sample results from 260 analyses of the 55 total project samples. Of the 2,819 analytical results, 2,570 originally-validated analytical results and qualifiers were verified to be correct. Revisions were required for 249 of the 2,819 result qualifiers (8.8%). The revisions performed by the QATS validators included changing, adding, or removing select qualifiers from the validated data.

A summary of the QATS-revised data qualifiers by SDG and fraction was prepared and is presented in tabular form in the next four pages of this report. Changes to the qualifiers were also applied to the individual EDD files. Changes to the EDD file that accompany this report are highlighted in blue.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/Compound	Original Qualifier	Revised Qualifier	EPA Sample ID	QATS Justification for EDD Revision
1406247 AROCLORS	Aroclor-1242	None	J	SC14-SD031-0.0/0.5 SC14-SD031-0.5/2.0 SC14-SD031-2.0/2.8 SC14-SD035-0.0/0.5DL	The Aroclor-1660 opening CCV failed. There was no Aroclor-1242 CCV analyzed.
1406247 AROCLORS	Aroclor-1016 Aroclor-1221 Aroclor-1232 Aroclor-1248 Aroclor-1254 Aroclor-1260 Aroclor-1262 Aroclor-1268	None	UJ	SC14-SD031-0.0/0.5 SC14-SD031-0.5/2.0 SC14-SD031-2.0/2.8	The Aroclor-1660 opening CCV failed. There were no Aroclor-1221, 1232, 1248, 1254, 1262, and 1268 CCVs analyzed.
1406247 AROCLORS	Aroclor-1016 Aroclor-1221 Aroclor-1232 Aroclor-1242 Aroclor-1248 Aroclor-1254 Aroclor-1260 Aroclor-1262 Aroclor-1268	None	UJ	SC14-SD030-2.0/2.8	The Aroclor-1660 opening CCV failed. There were no Aroclor-1221, 1232, 1242, 1248, 1254, 1262, and 1268 CCVs analyzed.
1406247 AROCLORS	Aroclor-1016 Aroclor-1221 Aroclor-1232 Aroclor-1242 Aroclor-1248 Aroclor-1260 Aroclor-1262 Aroclor-1268	None	UJ	SC14-SD030-0.5/2.0R	The associated Aroclor-1660 CCV failed. There were no Aroclor-1221, 1232, 1242, 1248, 1262, and 1268 CCVs analyzed.
1406247 AROCLORS	Aroclor-1242	None	J	SC14-SD029-0.0/0.5	The percent difference exceeded 25% between GC columns.
1406247 ASTM Particle Size	Clay (0.005 mm) Sand, Fine Sand, Very Fine, Silt	J	None	SC14-SD032-2.0/4.0	The original validators qualified Clay (0.005 mm); Sand, Fine; Sand, Very Fine; and Silt with a J qualifier due to the laboratory duplicate RPD. There appeared to be a sample discrepancy for the original sample ID and laboratory duplicate sample ID, which was confirmed and revised by the laboratory. The RPDs for the corrected sample and laboratory duplicate were within criteria. The J qualifiers were removed.
1406337 PAH	2,6-Dinitrotoluene 2-Nitroaniline 4-Nitroaniline Aniline	UJ or J	U or None	SC14-SD048-0.0/0.5 SC14-SD048-0.0/0.5R SC14-SD050-0.0/0.5	The four compounds listed were incorrectly qualified by the original validator because the ICV exceeded %D criteria. The ICV is defined in the laboratory SOP as "a second source standard used to verify the accuracy of the initial calibration." The quantitation of the sample result is based on a passing initial calibration and continuing calibration verification. Qualifying the results is not necessary based on a second source verification standard.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/Compound	Original Qualifier	Revised Qualifier	EPA Sample ID	QATS Justification for EDD Revision
1406337 PAH-SIM	2-Methlynaphthalene Acenaphthylene Naphthalene	None	J	SC14-SD047-0.0/0.5	The compounds listed were qualified by the QATS validator based on surrogate % recoveries that were outside of the laboratory's SOP acceptance limits.
1406337 PAH-SIM	2-Methlynaphthalene Acenaphthene Acenaphthylene Fluorene Naphthalene	None	J	SC14-SD047-0.5/1.3	The compounds listed were qualified by the QATS validator based on surrogate % recoveries that were outside of the laboratory's SOP acceptance limits.
1406337 PAH-SIM	Benzo(a)pyrene Benzo(b)fluoranthene	J	None	SC14-SD047-0.0/0.5	The original validators incorrectly qualified the compounds listed because the Internal Standard was out of criteria. The IS was out of criteria for the original undiluted sample. The results of the two compounds listed were from a diluted analysis (10x) in which the IS was within criteria.
1406337 PAH-SIM	Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene	J	None	SC14-SD047-0.5/1.3	The original validators incorrectly qualified the compounds listed because the Internal Standard was out of criteria. The IS was out of criteria for the original undiluted sample. The results of the three compounds listed were from a diluted analysis (10x) in which the IS was within criteria.
1406337 PAH-SIM	Benzo(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Chrysene Pyrene	J	None	SC14-SD048-0.0/0.5	The original validators incorrectly qualified the compounds listed because the Internal Standard was out of criteria. The IS was out of criteria for the original undiluted sample. The results of the five compounds listed were from a diluted analysis (10x) in which the IS was within criteria.
1406337 PAH-SIM	Benzo(a)anthracene Benzo(b)fluoranthene Pyrene	J	None	SC14-SD048-0.0/0.5R	The original validators incorrectly qualified the compounds listed because the Internal Standard was out of criteria. The IS was out of criteria for the original undiluted sample. The results of the three compounds listed were from a diluted analysis (10x) in which the IS was within criteria.
1406337 PAH-SIM	Acenaphthene Acenaphthylene	J	None	SC14-SD048-0.0/0.5 SC14-SD048-0.0/0.5R	The original validators qualified the analytes listed because the %RPD between the original sample and the field duplicate were outside of criteria. As a general GLNPO rule, the sample results are not qualified by QATS due to field duplicate RPD unless the RPD exceeds 100%. The RPDs greater than 50% are listed in the Validation Narrative. (Note that dibenz(a,h)anthracene is not listed because the J qualifier remained for that result due to the internal standard).
1406337 PAH-SIM	Pyrene	J	None	SC14-SD048-0.5/1.5	The original validators incorrectly qualified the compound listed because the Internal Standard was out of criteria. The IS was out of criteria for the original undiluted sample. The result of the compound listed was from a diluted analysis (10x) in which the IS was within criteria.
1406337 METALS	Beryllium	None	J	SC14-SD021-0.0/0.5 SC14-SD021-0.5/1.1 SC14-SD047-0.0/0.5	The three samples listed were bracketed by a CCV that failed the percent recovery criteria of 90-110% for beryllium.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/Compound	Original Qualifier	Revised Qualifier	EPA Sample ID	QATS Justification for EDD Revision
1406337 METALS	Silver	J	U	SC14-SD049-0.0/0.5	Trace levels of silver between the MDL and CRQL were detected in the CCBs. The level detected in the sample was less than 5x the concentration observed in the CCBs.
1406337 AROCLORS	Aroclor-1242	None	J	SC14-SD026-0.5/2.0	The percent difference exceeded 25% between GC columns. In addition, the associated Aroclor-1660 CCV failed high. There was no Aroclor-1242 CCV analyzed.
1406337 AROCLORS	Aroclor-1248	None	J	SC14-SD047-0.0/0.5 SC14-SD047-0.5/1.3 SC14-SD048-0.0/0.5 SC14-SD048-0.0/0.5R SC14-SD048-0.5/1.5 SC14-SD049-0.0/0.5 SC14-SD050-0.0/0.5	The associated Aroclor-1660 CCV failed. There was no Aroclor-1248 CCV analyzed.
1406337 AROCLORS	Aroclor-1016 Aroclor-1221 Aroclor-1232 Aroclor-1248 Aroclor-1254 Aroclor-1260 Aroclor-1262 Aroclor-1268	None	UJ	SC14-SD026-0.5/2.0	The associated Aroclor-1660 CCV failed. There were no Aroclor-1221, 1232, 1248, 1254, 1262, and 1268 CCVs analyzed.
1406337 AROCLORS	Aroclor-1016 Aroclor-1221 Aroclor-1232 Aroclor-1242 Aroclor-1254 Aroclor-1260 Aroclor-1262 Aroclor-1268	None	UJ	SC14-SD047-0.0/0.5 SC14-SD047-0.5/1.3 SC14-SD048-0.0/0.5 SC14-SD048-0.0/0.5R SC14-SD048-0.5/1.5 SC14-SD049-0.0/0.5 SC14-SD050-0.0/0.5	The associated Aroclor-1660 CCV failed. There were no Aroclor-1221, 1232, 1242, 1254, 1262, and 1268 CCVs analyzed.
1406337 AROCLORS	Aroclor-1016 Aroclor-1221 Aroclor-1232 Aroclor-1242 Aroclor-1248 Aroclor-1254 Aroclor-1260 Aroclor-1262 Aroclor-1268	None	UJ	SC14-SD050-0.5/1.7	The Aroclor-1660 opening CCV failed. There were no Aroclor-1221, 1232, 1242, 1248, 1254, 1262, and 1268 CCVs analyzed.
1406411 PAH	Aniline	None	UJ	EB001	The associated LCS percent recovery was below the acceptance criteria.
1406411 PAH	2,4-Dinitrophenol	None	UJ	SC14-SD036-0.5/2.0 SC14-SD037-0.0/0.5 SC14-SD044-0.5/1.3 SC14-SD044-0.5/1.8D	The associated samples are qualified for continuing calibration %D failure.

DATA QUALIFICATION CHANGES SUMMARY TABLE

SDG/Fraction	Analyte/Compound	Original Qualifier	Revised Qualifier	EPA Sample ID	QATS Justification for EDD Revision
				SC14-SD045-0.5/1.7	
1406411 PAH	2-Methylphenol	None	UJ	SC14-SD036-0.5/2.0 SC14-SD037-0.0/0.5 SC14-SD044-0.5/1.3 SC14-SD044-0.5/1.8D SC14-SD045-0.5/1.7	The associated samples are qualified for an RRF value that was below the RRF value listed in the laboratory SOP.
1406411 PAH SIM	2-Methylnaphthalene Acenaphthene Acenaphthylene Fluorene Naphthalene	None	J or UJ	SC14-SD037-0.0/0.5 SC14-SD045-0.0/0.5	Associated compounds are qualified J or UJ because the associated surrogate recoveries exceed the acceptance limits listed in the laboratory SOP.
1406411 METALS	Beryllium Cobalt Nickel Thallium	J	U	EB001	Trace levels of beryllium, cobalt, nickel, and thallium between the MDL and CRQL were detected in the ICB, CCB, and/or MB. The levels detected in the sample were less than the concentrations observed in the blanks.
1406411 METALS	Silver	J	U	SC14-SD036-0.0/0.5 SC14-SD044-0.5/1.8D	Trace levels of silver between the MDL and CRQL were detected in the CCBs. The levels detected in the samples were less than 5x the concentration observed in the CCBs.
1406411 METALS	Barium Lead Manganese Vanadium Zinc	J	None	SC14-SD044-0.5/1.3 SC14-SD044-0.5/1.8D	The original validators qualified the analytes listed because the %RPD between the original sample and the field duplicate were outside of criteria. As a general GLNPO rule, the sample results are not qualified by QATS due to field duplicate RPD unless the RPD exceeds 100%. The RPDs greater than 50% are listed in the Validation Narrative.
1406411 AROCLORS	Aroclor-1016 Aroclor-1221 Aroclor-1232 Aroclor-1242 Aroclor-1248 Aroclor-1254 Aroclor-1260 Aroclor-1262 Aroclor-1268	None	UJ	EB001	Associated 1660 CCV failed. In addition, the DCB surrogate recovery was below the acceptance limits provided in the laboratory SOP.
1406411 AROCLORS	Aroclor-1242	None	J	SC14-SD037-0.0/0.5 SC14-SD037-0.5/1.15 SC14-SD044-0.0/0.5 SC14-SD044-0.5/1.8D SC14-SD045-0.0/0.5 SC14-SD045-0.5/1.7	The associated Aroclor-1660 CCV failed. There was no Aroclor-1242 CCV analyzed.
1406411 AROCLORS	Aroclor-1242	None	J	SC14-SD036-0.5/2.0 SC14-SD045-0.0/0.5	Percent difference exceeded 25% between GC columns.
