RE: Lead mapping

Brief background: Tanglewood Water Division serves Tanglewood Lake Association homes and a small shopping center with Giant Eagle grocery store and small businesses. We have a total of 572 home site connections split roughly evenly between individual homes and individual condos. Our system provided approximately 42,000,000 gallons of water to our community in 2016.

The land for Tanglewood was purchased 1966 with development in 1967 with home construction started in 1968.

In 2009 we started a complete change out of all old manual read meters to new AMR meters installed under contract in conjunction with our chosen contractor NORHIO. I was involved until it was finished in 2016 and all meters were installed in copper bridles that fit our standard sized meter. There were no lead service lines noted at that time as I would have had to approve extra charges by the contractor.

I have personally been in many of the houses including one of the ones built in 1968 and have not seen anything but copper pipe.

As plant operator I have supervised the repair of many 6" distribution line breaks and there are only three different types of main line materials, Ductile Iron, Transite, and the newest PVC. As part of our home owners agreement property owners are responsible for maintenance of the service line when it leaves our 6" main.

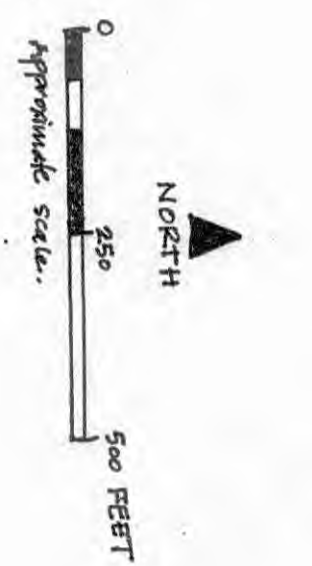

Please advise if you have any questions.

Very truly yours,

David Beary
Plant Operator
