Dear Sirs,

Buildings in Ohio built prior to 1998 or that use plumbing material or solder manufactured before 1998 may have materials with greater than 8% lead and are at a higher risk of contributing lead to the drinking water than materials manufactured after 1998. In addition, buildings built and plumbing materials manufactured after 2014 were required to have less than 0.25% lead by weight and have the lowest risk for contributing lead to the drinking water. It should be noted however that, although prohibited, some use of leaded solder or leaded components may have occurred after the prohibitions became effective.

The houses in the Millers Acre's Home owners Association housing development were built in the 1970's. All houses have copper plumbing. The service line entering the houses are made of copper.

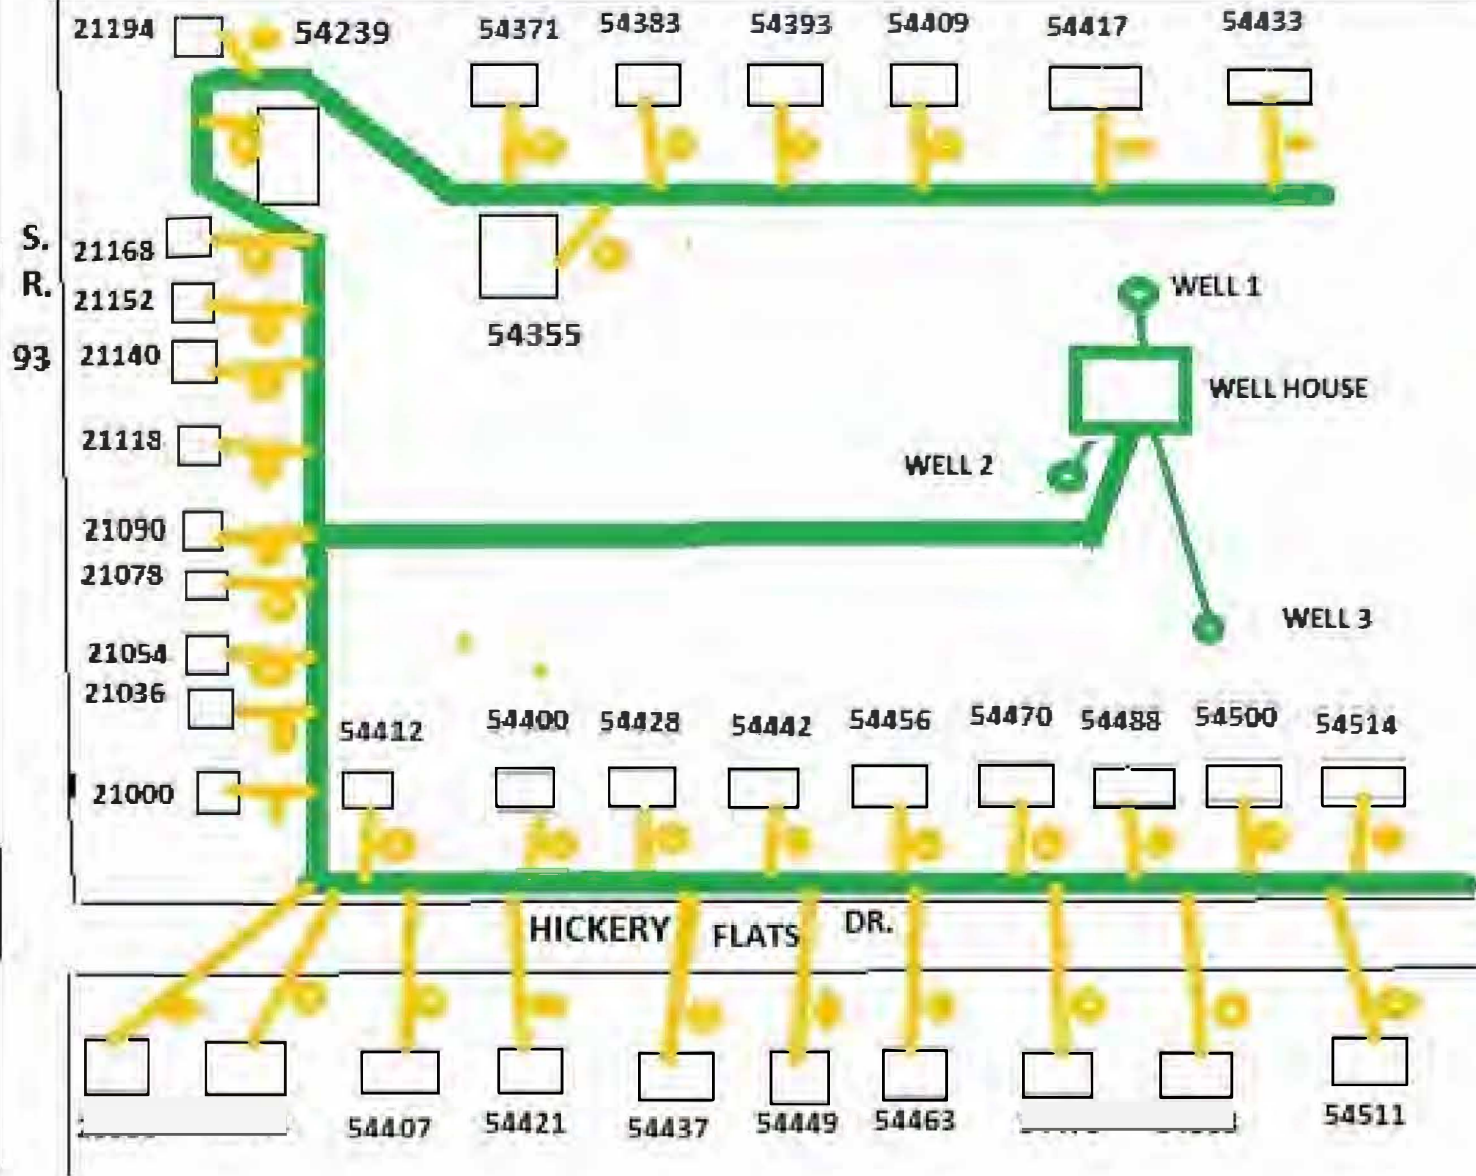

The plumbing in the well house is made of PVC and galvanized piping. All of the main water lines are 6 inches made of ductile pipe. There is very little to no lead in these lines.

The service lines from the main lines to the houses are made of copper. The curb boxes have copper valves. Miller's Acre's Home Owners Association owns the copper piping from the main line to the curb box which is a small amount of the water lines in the Association.

The risk of lead in the Miller's Acre's Home Owners Association is very low. The mapping of the Association has been attached.
