February 1, 2017

Enclosed you will find mapping of the Scioto Sign Co, sampling sites. Each sampling site is color coded on the maps and information on each site is attached as well. The spread sheet is also color coded, matching each site with the information needed for sampling. The original building was built in 1972 and the plumbing in that area is plastic and CuPb <83. The art addition was added in 1985 and plumbing in that addition is plastic and some CuPb >82. There are no lead lines in the water system in the whole plant. Because it is practically impossible to determine the lead content of an installed fixture, fitting or pipe, it should be assumed that the manufacture or installation date is the primary indicator of the lead content. Therefore, the characteristics of buildings and piping solder or fixtures would be **buildings in Ohio built prior to 1998 or that use plumbing material or solder manufactured before 1998 may have materials with greater than 8% lead and are at a higher risk of contributing lead to the drinking water than materials manufactured after 1998. In addition, buildings built and plumbing materials manufactured after 2014 were required to have less than 0.25% lead by weight and have the lowest risk for contributing lead to the drinking water. It should be noted however that, although prohibited, some use of leaded solder or leaded components may have occurred after the prohibitions became effective. Any questions, I can be reached at 419-674-8364 or e-mail at [pcramer2@roadrunner.com](mailto:pcramer2@roadrunner.com)**
