Carbon Hill Water

Construction on the Carbon Hill Water Association began in 1968 and continues through 2017. The Carbon Hill Water Association distribution system does not contain any lead service lines. Lead service lines were legislatively banned from 1930 to 1950. The carbon Hill Water Association has always, and continues to use PVC pipe for connections from the water mains to the water meter. It is the homeowner's responsibility to install and maintain their service line from the meter set to the interior of the dwelling. In areas where The Carbon Hill Water Association has extended service, previously installed service lines would not have existed. The customer installs their service line at the time the meter is set by The Carbon hill Water Association.

Because it is practically impossible to determine the lead content of an installed fixture, fitting or pipe, it should be assumed that the manufacturer or installation date is the primary indicator of the lead content. Therefore, the characteristics of buildings and piping solder or fixtures would be buildings in Ohio built prior to 1998 or that use plumbing material or solder manufactured before 1998 may have materials with greater than 8% lead and are at a higher risk of contributing lead to the drinking water than materials manufactured after 1998. In addition, buildings built and plumbing materials manufactured after 2014 were required to have less than 025% lead by weight and have the lowest risk for contributing lead to the drinking water. It should be noted however that, although prohibited, some use of leaded solder or leaded components may have occurred after the prohibitions became effective.
