Licking County

Lead Mapping Narrative

Tap Cards were used as primary reference for creating Lead mapping. When available the service line material listed on the tap card was used for the determination of whether service line is possible lead or not. If the material used for the service line was not listed on the tap card then the tap date was used as a reference for whether the line is possible lead. If the structure was built before 1998 then it was assumed to have lead or lead solder. If the service line material was not listed and there was no date on tap card then it was color coded as no information. Licking County will continue to update the mapping information when discovered by routine maintenance of lines and meter replacement.
