All potable water plumbing has been certified by the operator as lead free. All piping in the older buildings is PVC. Copper piping, where installed is joined with lead-free solder.

The system contains one fixture installed prior to 1998. It is an industrial hydrant used exclusively in non-potable applications. This fixture is located in the nonferrous metals building. All lines supplying water to that and other buildings are plastic.

Potentially Lead Containing   
 Lead Free  Year

Buildings in Ohio built prior to 1998 or that use plumbing material or solder manufactured before 1998 may have materials with greater than 8% lead and are at a higher risk of contributing lead to the drinking water than materials manufactured after 1998. In addition, buildings built and plumbing materials manufactured after 2014 were required to have less than 0.25% lead by weight and have the lowest risk for contributing lead to the drinking water. It should be noted however that, although prohibited, some use of leaded solder or leaded components may have occurred in the years prohibitions became effective. Dates in parentheses are approximate.
