August Mack Project Number JY2380.372

Dear Ms. Nesbit:

August Mack Environmental, Inc. (August Mack), on behalf of Material Sciences Corporation (MSC), is submitting this Initial Site Investigation (ISI) Report for the MSC facility property located at 460 West Main Street, Canfield, Ohio (Site). This report includes pertinent Site background information, a summary of investigation activities, sampling procedures, laboratory analytical results, and planned next steps.

1 BACKGROUND INFORMATION

The Site is a metal galvanizing and coil coating facility located in Canfield, Ohio and has been operating since the 1950s under various entities including Canfield Steel and Pittsburgh Steel. MSC acquired the facility in 2013 and has operated the Site since then. In July 2024, MSC conducted a cleaning of process lines and equipment during its regularly scheduled maintenance operations, which appeared to dislodge dark brown process water with a high pH that contained cyanide and metals. The process water breached a previously abandoned drainage pipe and was released to the Adjacent Ditch located northeast of the facility along the Mill Creek Metro Park Bikeway. On July 11, 2024, the process water was visually observed in the ditch by a pedestrian on the bikeway who notified the local Canfield Fire Department. The Canfield Fire Department then notified MSC and the Ohio Environmental Protection Agency (Ohio EPA) of the discharge. Approximately 1,000 feet of the Adjacent Ditch was impacted by the process water and MSC was issued a Notice of Violation (NOV) from the Ohio EPA on October 11, 2024 for unlawful disposal of hazardous waste. MSC and August Mack are currently

working with Ohio EPA to establish a Director's Final Findings and Orders to address the NOV and future actions at the Site.

In response to the release, MSC contracted with various environmental service providers such as THG & Associates (THG), Environmental Response Contractor (ERC), and August Mack to assess, respond, contain and cleanup the released process water. Since being contracted in mid-August, August Mack has performed numerous interim measure activities, including but not limited to the following:

- Installing temporary dams and five sumps within the Adjacent Ditch to collect impacted stormwater into on-Site storage tanks and stop any migration into the surface water feature that is located north of the Site,
- Diverting clean stormwater away from the Adjacent Ditch
- Collecting impacted water from subsurface drainage pipes into on-Site storage tanks,
- Properly disposing of approximately 115,000 gallons of impacted water off-Site as hazardous waste,
- Installing a fence between the Adjacent Ditch and the Bikeway, and
- Installing a liner on approximately 1,200 feet of the Adjacent Ditch in accordance with the Ditch Interim Measures Plan, dated November 15, 2024, that was approved by the Ohio EPA (the liner installation is currently ongoing).

Since August Mack's involvement there has been no breach of impacted process water past the line of compliance dam, formerly the Ohio EPA plywood dam, which is at the end of the Adjacent Ditch. Details associated with water collection efforts continue to be discussed with Ohio EPA weekly and submitted in weekly reports. A report regarding the lining of the ditch will be provided under a separate cover following the ditch liner installation completion.

As part of the ongoing response, August Mack conducted investigations on-Site, within the Adjacent Ditch, within the Surface Water Feature to the north of the property, and within Sawmill Creek to assess potential soil, surface water, and groundwater impacts associated with the release. The work was performed in general accordance with the Ohio EPA approved Sampling and Analysis Plan (SAP) dated September 31, 2024. Details and results of the investigation are provided below.

2 INVESTIGATION METHODS

2.1 On-Site Soil Borings

Prior to advancing soil borings, August Mack contacted Ohio 811 to clear public underground utilities at the Site. Additionally, a private utility locate was conducted using ground penetrating radar and electromagnetic survey techniques to locate utilities in the vicinity of soil boring locations.

August Mack mobilized to the Site in October 2024 to initiate soil sampling activities. A total of 21 soil borings (SB-1 through SB-4 and SB-6 through SB-22)[1] were advanced using a Geoprobe® Direct Push Sampling System (Geoprobe®) to a maximum depth of 34 feet below grade (ft bg). Soil was collected continuously in two-foot intervals from each boring for the purpose of lithologic description, field screening for pH utilizing a soil pH probe, and headspace analysis utilizing a photoionization detector (PID). Depending on the data quality objective for the boring location and field conditions, up to three unsaturated soil samples were collected from each boring. The sampling intervals were chosen based on visual staining/odor and elevated pH/PID readings. A total of 53 soil samples were collected from on-Site borings, which includes Quality assurance/Quality control (QA/QC) samples collected at the minimum frequency described below:

- One duplicate sample collected per 10 samples
- One matrix spike/matrix spike duplicate (MS/MSD) per 20 samples
- One trip blank per cooler per day
- One equipment blank (EB) and one rinse blank (RB) per event.

Samples were submitted to Eurofins Environment Testing in Barberton, Ohio for laboratory analysis of chemicals of concern (COCs) listed in **Table 1**. Contrary to the methods listed in the SAP, hexavalent chromium, total cyanide, and free cyanide were analyzed by U.S. EPA methods 7199, 9012, and OIA1677, respectively. These methods were the only methods available through Eurofins Environment Testing for the given parameters but are comparable to the original methods listed in the SAP. Soil samples were collected in accordance with the field procedures provided in **Attachment A**. The soil boring logs are included in **Attachment B**. Soil boring locations are shown on **Figure 1A**.

[1] Please note that proposed soil boring, SB-5, was not advanced due to the location not being accessible by Geoprobe®.

2.2 On-Site Grab Groundwater Sampling

Following soil boring advancement, temporary one-inch piezometers were installed to collect grab groundwater samples from each boring. Samples were collected via peristaltic pump and submitted to Eurofins Environment Testing in Barberton, Ohio for laboratory analysis for COCs listed in **Table 1**. Samples submitted for dissolved metals were field filtered. A total of 24 grab groundwater samples were collected, which includes QA/QC samples collected at the minimum frequency described below:

- One duplicate sample per 10 samples
- One MS and one MSD sample per 20 samples
- One trip blank per cooler per day

Grab groundwater samples were collected in accordance with the field procedures provided in **Attachment A**.

2.3 On-Site Monitoring Well Installation

Upon completion of soil boring activities, 15 soil boring locations (SB-1, SB-4, SB-7, SB-8, SB-9, SB-10, SB-11, SB-12, SB-13, SB-14, SB-16, SB-17, SB-18 SB-19, SB-20) were converted into permanent, 2-inch monitoring wells (MW-1 through MW-15) using hollow-stem auger (HSA) drilling techniques. Following installation, the monitoring wells were properly developed and surveyed by a licensed professional surveyor. The monitoring well locations are shown on **Figure 1A**. August Mack field procedures are provided as **Attachment A**. The monitoring well construction diagrams are provided as **Attachment B**.

The monitoring wells were allowed to equilibrate for at least one week following well installation and development. Groundwater elevation data was collected from the monitoring well network to assess the hydrogeologic conditions at the Site. Groundwater elevation measurements were collected in accordance with August Mack field procedures provided as **Attachment A**. Monitoring well information and depth-to-water measurements are presented in **Table 2**. Calculated potentiometric surface contours from the gauging event are depicted on **Figure 2.**

August Mack completed the low-flow groundwater sampling event of the 15 monitoring wells in late November 2024. The sampling results are forthcoming and additional information will be provided under a separate cover.

2.4 Surface Water Feature Sampling

August Mack conducted soil and water sampling of the Surface Water Feature located to the north of the Site in October 2024. A total of 14 soil borings (SB-23 through SB-36) were advanced using hand auger sampling techniques. Soil at each location was collected at depths of zero ft, one-half ft, and two ft bg, except when subsurface conditions caused refusal. At the request of Ohio EPA, two surface water samples were collected using new disposable syringes at two boring locations (SB-29 and SB-36). Soil and surface water samples were submitted to Eurofins Environment Testing in Barberton, OH for the laboratory analysis of COCs listed in **Table 1**. A total of 47 soil samples collected from the Surface Water Feature, which includes QA/QC samples collected at the minimum frequency described below:

- One duplicate sample per 10 samples
- One MS/MSD sample per 20 samples
- One trip blank per cooler per day
- One EB and one RB per event.

Soil boring and surface water sampling locations of the water feature are provided in **Figure 1B.** August Mack field procedures are provided **Attachment A**.

2.5 Adjacent Ditch and Sawmill Creek Sampling

August Mack mobilized to the Site in October 2024[2] to conduct soil and surface water sampling of the Adjacent Ditch located to the east of the Site. At the request of Ohio EPA, August Mack also sampled Sawmill Creek, which is downstream of the Surface Water Feature and located to the northeast of the Site. A total of 148 soil samples were collected at 26 transects along the Adjacent Ditch and Sawmill Creek, as shown in **Figure 1C**. The transects were spaced approximately every 125 feet based on site conditions and accessibility.

August Mack collected soil samples at three evenly spaced locations within the Adjacent Ditch and Sawmill Creek across each transect (one from each bank and one from the center line). Samples were also collected at different depths using a disposable scoop and hand auger. Maximum sampling depth ranged from one to four ft bg depending on subsurface conditions encountered (e.g., gravel causing refusal). A total of 79 soil samples

[2] Prior to August Mack involvement, THG collected soil samples within the Adjacent Ditch. These results are presented in the tables as part of this report, but they are not discussed in detail because August Mack sampling encompassed these locations within the Adjacent Ditch.

were collected from the Adjacent Ditch, and 69 soil samples were collected from Sawmill Creek.

In addition to collecting soil samples, four surface water samples were collected utilizing unused disposable syringes within the Adjacent Ditch and three surface water samples were collected within Sawmill Creek. Soil and surface water samples were submitted to Eurofins Environment Testing in Barberton, Ohio and analyzed for the COCs presented in **Table 1**. In addition to collecting soil samples from each location at each depth for the parameters listed above, appropriate QA/QC samples were collected, including the following items:

- One duplicate sample per 10 samples
- One MS/ MSD sample per 20 samples
- One trip blank per cooler per day
- One EB and one RB per event.

August Mack field procedures are provided in **Attachment A**. Sampling locations are shown on **Figure 1C**.

3 INVESTIGATION RESULTS

A total of 248 soil samples and 24 grab groundwater samples were collected during the Initial Site Investigation. Based on the facility's historical Site usage and metal galvanizing/coating processes, the primary COCs for the Site are Cyanide, Zinc, Hexavalent Chromium, and Trichloroethene. Due to the nature of the recent release, the ISI focused on the primary COCs as well as an extensive suite of additional analytes. The laboratory data for all COCs and additional analytes have been included as part of the Figures, Tables, and Attachments. Considering the volume of data collected as part of the ISI, the following investigation result sections are focused on the Site's primary COCs. Detections of the primary Site COCs are organized by each sampling effort and are detailed in the following sections.

3.1 On-Site Soil Boring Analytical Results

The on-Site subsurface soil analytical results were compared to the U.S. EPA Industrial RSL, and exceeded the RSL at the following locations:

- Total cyanide was reported above the EPA Industrial RSL in one sample collected from SB-12B at a depth of 4-6 ft bg.

- Although arsenic exceeded the Industrial RSL, concentrations are generally within background levels established in the Ohio EPA *Evaluation of Background Metal Soil Concentrations in Mahoning County* report.

The on-Site soil analytical results are summarized in **Table 3** and on **Figure 3**. Copies of the laboratory analytical reports are included in **Attachment C.**

3.2 Grab Groundwater Analytical Results

The grab groundwater analytical results were compared to the Ground Water Protection Standards (GWPS).[3] The following locations exceeded GWPS for the primary COCs:

- Trichloroethene exceeded the GWPS in five samples
- Hexavalent chromium exceeded the GWPS in four samples
- Total Zinc exceeded the GWPS in five samples; however, the dissolved Zinc concentrations were below the GWPS in every sample.

The grab groundwater samples were turbid due to the sample collection method; therefore, the dissolved metals results were consistently less than the total metals results. The grab groundwater analytical results are summarized in **Table 4** and on **Figure 4**. Copies of the laboratory analytical reports are included in **Attachment C.**

3.3 Surface Water Feature Soil Analytical Results

Soil analytical results collected from the Surface Water Feature were compared to the established US EPA 2024 Residential and Industrial RSLs. The primary COC exceedances in soil within the Surface Water Feature are as follows:

- Total cyanide exceeded the Zinc exceeded Residential RSL in 17 samples.
- Although arsenic exceeded the Industrial RSL, it appears that concentrations are within background levels based on the Ohio EPA *Evaluation of Background Metal Soil Concentrations in Mahoning County* report.

The Surface Water Feature soil analytical results are summarized in **Table 5** and on **Figure 5**. Copies of the laboratory analytical reports are included in **Attachment C.**

[3] The GWPS is defined as the applicable Maximum Contaminant Level (MCL) or RSL tap water values with a TR of 1E-06 and a THQ of 0.1 when no MCL exists.

3.4 Adjacent Ditch and Sawmill Creek Soil Results

Soil analytical results from the Adjacent Ditch and Sawmill Creek were compared to U.S. EPA Residential and/or Industrial RSLs. Primary COC exceedances in soil samples from the Adjacent Ditch and Sawmill Creek are as follows:

- Adjacent Ditch soil results
  - Zinc exceeded the Residential RSL in 20 samples
  - Hexavalent chromium exceeded the Residential RSL in two samples
  - Total cyanide exceeded the Industrial RSLs in 47 samples and 15 samples exceeded Residential RSLs
  - Although arsenic exceeded the Industrial and Residential RSLs, it appears that concentrations are within background levels based on the Ohio EPA *Evaluation of Background Metal Soil Concentrations in Mahoning County* report.

- Sawmill Creek soil results
  - Zinc exceeded the Residential RSL in six samples
  - Hexavalent chromium exceeded the Residential RSL in six samples
  - Total cyanide exceeded the Residential RSLs in 52 samples.
  - Although arsenic exceeded the Residential RSL, it appears that concentrations are within background levels based on the Ohio EPA *Evaluation of Background Metal Soil Concentrations in Mahoning County* report.

The Adjacent Ditch and Sawmill Creek soil analytical results are summarized in **Table 6** and **Table 7**, respectively. The Adjacent Ditch and Sawmill Creek exceeding locations are shown on **Figure 6** and **Figure 7**, respectively. The Sawmill Creek results were only compared to Residential RSLs on the figure. Copies of the laboratory analytical reports are included in **Attachment C.**

3.5 Adjacent Ditch, Surface Water Feature, and Sawmill Creek Surface Water Analytical Results

The Adjacent Ditch, Surface Water Feature, and Sawmill Creek surface water analytical results were compared to the established Ohio EPA Non-Drinking Surface Water Human Health Criteria.[4] Primary COC exceedances of the Ohio EPA Non-Drinking Surface

[4] https://dam.assets.ohio.gov/image/upload/epa.ohio.gov/Portals/35/wqs/Ohioval_April_9_2021.pdf

Water Human Health within the Adjacent Ditch, Surface Water Feature, and Sawmill Creek were as follows:

- Zinc exceeded the Human Health Criteria in two samples collected within the Adjacent Ditch.
- No primary COCs were reported in samples from the Surface Water Feature or Sawmill Creek at concentrations above the Human Health Criteria.

The Adjacent Ditch, Surface Water Feature, and Sawmill Creek surface water analytical results are summarized in **Table 8.** Exceedances are depicted on **Figure 8, Figure 9, and Figure 10,** respectively. Copies of the laboratory analytical reports are included in **Attachment C.**

4 SUMMARY AND NEXT STEPS

In response to the July 2024 release, MSC has worked collaboratively with Ohio EPA to conduct numerous interim measure activities to address the release and the associated potential exposure concerns. In addition, August Mack conducted an extensive initial investigation on and off-Site, which was done in accordance with the Ohio EPA approved SAP. The efforts completed as part of this ISI report are as follows:

- Advanced 21 soil borings on-Site to collect 53 soil samples,
- Collected 24 grab groundwater samples,
- Installed and developed 15 monitoring wells,
- Collected 79 soil and four surface water samples in the Adjacent Ditch,
- Collected 47 soil and two surface water samples in the Surface Water Feature north of the Site, and
- Collected 69 soil and three surface water samples in Sawmill Creek.

Groundwater sampling from the recently installed monitoring well network is the only remaining sampling for the SAP, which was completed in late November 2024. The groundwater analytical data is still being received from the laboratory and the results will be submitted under a separate cover.

In summary, analytical results show that impacts are present in on-Site soils and groundwater, as well as off-Site soil and surface water. August Mack will evaluate the recently collected groundwater data in conjunction with the analytical data presented in this report to determine what additional sampling is needed to fully characterize the Site.

Currently August Mack is preparing to perform the following interim measures and additional sampling activities:

- Additional soil sampling within Sawmill Creek to determine potential interim measures (e.g., fencing),
- Vapor intrusion sampling within the facility,
- Ecological assessment following Ohio EPA guidance in the Surface Water Feature,
- Continue to divert clean stormwater away from the Adjacent Ditch, and to collect impacted stormwater into on-Site storage tanks to stop any migration into the Surface Water Feature,
- Finish lining the Adjacent Ditch to prevent direct contact and to bypass clean storm water over impacted sediments.

Please feel free to contact us if you have any questions or comments.

Based on the GWPS ingestion exposure route, only the dissolved fraction of metals is presented as compared to the GWPS. See associated analytical summary table for concentrations of total metals in groundwater.

Results and Screening Levels are reported in micrograms per liter (ug/L). Analyzed compounds not listed were not detected above Ohio EPA GWPS.

GWPSs are based on the U.S. EPA Regional Screening Levels (RSLs) Generic Tables April 2024 Update.

Per the U.S. EPA's RSL User's Guide, the chemical abstract services number (CAS#) for total cyanide is based on free cyanide toxicity. Since cyanide speciation was performed as part of Site investigation, the total cyanide RSL is listed as NE and free cyanide results are compared to the U.S. EPA RSL.

The following denote the color of screening level exceedances:

* = At or Above Ohio EPA GWPS

Abbreviations & Notes:

BRL = Below Laboratory Reporting Limits; PCB = Polychlorinated Biphenyls

RSLs = Regional Screening Levels; VOCs = Volatile Organic Compounds

U.S. EPA = United States Environmental Protection Agency

Other analyzed compounds not listed were detected at concentrations below applicable RSLs (<RSLs).

Results and U.S. EPA Screening Levels are reported in miligrams per kilogram (mg/kg).

U.S. EPA RSLs are based on the Regional Screening Levels Generic Tables April 2024 Update.

RSLs are based on a 1E-6 target cancer risk and a 0.1 target hazard quotient (THQ).

The following denote the color of screening level exceedances:

* = At or Above U.S. EPA 2024 Resident Soil RSLs

** = At or Above U.S. EPA 2024 Industrial Soil RSLs

BRL = Below Laboratory Reporting Limits

RSLs = Regional Screening Levels

U.S. EPA = United States Environmental Protection Agency

All results and U.S. EPA Screening Levels are reported in milligrams per kilogram (mg/kg).

U.S. EPA RSLs are based on the Regional Screening Levels Generic Tables April 2024 Update.

RSLs are based on a 1E-6 target cancer risk and a 0.1 target hazard quotient (THQ).

The following denote the color of screening level exceedances:

* = At or Above U.S. EPA 2024 Resident Soil RSLs

The higher of the two values between original sample and duplicate sample is posted if a compound exceeds OH EPA Surface Water.

Results and Screening Levels are reported in micrograms per liter (ug/L). Analyzed compounds not listed were not detected above Ohio EPA Surface Water Criteria (<SurfCrit).

Per the U.S. EPA's RSL User's Guide, the chemical abstract services number (CAS#) for total cyanide is based on free cyanide toxicity. Since cyanide speciation was performed as part of Site investigation, the total cyanide OH EPA Surface Water Criteria is listed as NE and free cyanide results are compared to the OH EPA Surface Water Criteria.

The following denote the color of screening level exceedances:

Abbreviations & Notes

NF = Not Established; RSLs = Regional Screening Levels
J = Reported value is estimated
USEPA = United States Environmental Protection Agency; SSLs = Soil Screening Levels
All results and USEPA Screening Levels are reported in milligrams per kilogram (mg/kg).
USEPA RSLs are based on the Regional Screening Levels Generic Tables April 2024 Update.
RSLs are based on a 1E-6 target cancer risk and a 0.1 target hazard quotient (THQ).

The following denote the symbol and color of screening level exceedances:
** = At or Above USEPA 2024 Industrial Soil RSLs

Abbreviations & Notes

NF = Not Established; RSLs = Regional Screening Levels

J = Reported value is estimated

USEPA = United States Environmental Protection Agency; SSLs = Soil Screening Levels

All results and USEPA Screening Levels are reported in milligrams per kilogram (mg/kg).

USEPA RSLs are based on the Regional Screening Levels Generic Tables April 2024 Update.

RSLs are based on a 1E-6 target cancer risk and a 0.1 target hazard quotient (THQ).

The following denote the symbol and color of screening level exceedances:

** = At or Above USEPA 2024 Industrial Soil RSLs

Abbreviations & Notes

NF = Not Established; RSLs = Regional Screening Levels
J = Reported value is estimated
USEPA = United States Environmental Protection Agency; SSLs = Soil Screening Levels
All results and USEPA Screening Levels are reported in milligrams per kilogram (mg/kg).
USEPA RSLs are based on the Regional Screening Levels Generic Tables April 2024 Update.
RSLs are based on a 1E-6 target cancer risk and a 0.1 target hazard quotient (THQ).

The following denote the symbol and color of screening level exceedances:

** = At or Above USEPA 2024 Industrial Soil RSLs

Abbreviations & Notes

NE = Not Established; RSLs = Regional Screening Levels
J = Reported value is estimated
USEPA = United States Environmental Protection Agency; SSLs = Soil Screening Levels
All results and USEPA Screening Levels are reported in miligrams per kilogram (mg/kg).
USEPA RSLs are based on the Regional Screening Levels Generic Tables April 2024 Update.
RSLs are based on a 1E-6 target cancer risk and a 0.1 target hazard quotient (THQ).

The following denote the symbol and color of screening level exceedances:

* = At or Above USEPA 2024 Resident Soil RSL
** = At or Above USEPA 2024 Industrial Soil RSLs

Abbreviations & Notes

NE = Not Established; RSLs = Regional Screening Levels
J = Reported value is estimated
USEPA = United States Environmental Protection Agency; SSLs = Soil Screening Levels
All results and USEPA Screening Levels are reported in miligrams per kilogram (mg/kg).
USEPA RSLs are based on the Regional Screening Levels Generic Tables April 2024 Update.
RSLs are based on a 1E-6 target cancer risk and a 0.1 target hazard quotient (THQ).

The following denote the symbol and color of screening level exceedances:

* = At or Above USEPA 2024 Resident Soil RSL
** = At or Above USEPA 2024 Industrial Soil RSLs

Abbreviations & Notes

NE = Not Established; RSLs = Regional Screening Levels
J = Reported value is estimated
USEPA = United States Environmental Protection Agency; SSLs = Soil Screening Levels
All results and USEPA Screening Levels are reported in miligrams per kilogram (mg/kg).
USEPA RSLs are based on the Regional Screening Levels Generic Tables April 2024 Update.
RSLs are based on a 1E-6 target cancer risk and a 0.1 target hazard quotient (THQ).

The following denote the symbol and color of screening level exceedances:

* = At or Above USEPA 2024 Resident Soil RSL
** = At or Above USEPA 2024 Industrial Soil RSLs

Abbreviations & Notes

NE = Not Established; RSLs = Regional Screening Levels
J = Reported value is estimated
USEPA = United States Environmental Protection Agency; SSLs = Soil Screening Levels
All results and USEPA Screening Levels are reported in miligrams per kilogram (mg/kg).
USEPA RSLs are based on the Regional Screening Levels Generic Tables April 2024 Update.
RSLs are based on a 1E-6 target cancer risk and a 0.1 target hazard quotient (THQ).

The following denote the symbol and color of screening level exceedances:
* = At or Above USEPA 2024 Resident Soil RSL
** = At or Above USEPA 2024 Industrial Soil RSLs

Field Procedures

GEOPROBE® DRILLING SOIL SAMPLING PROCEDURES

Drilling was performed in accordance with standard United States Environmental Protection Agency (U.S. EPA) protocols.

Soil borings were advanced using a Geoprobe® Direct Push Sampling System. Soil borings were advanced to the desired depth required for the investigation. Soil samples were collected continuously from each boring location by pushing a 4-foot long nickel-plated core barrel sampler, recovering a continuous, undisturbed soil sample within a disposable acetate liner inside the core barrel sampler. A new acetate liner was used for each sample collected. Upon retrieval, each soil core was capped to prevent volatilization and set aside until the terminal depth of the boring was reached. All soil samples were handled with new, clean nitrile sampling gloves to prevent cross-contamination between samples. All reusable equipment used to collect the soil samples was decontaminated with a Liquinox® solution (or equivalent) and rinsed with distilled water and deionized water between each boring location.

Once all cores were retrieved, each 4-foot section of soil was opened one at a time and divided into 2-foot sections. Each 2-foot section was screened in the field using a MiniRae® photoionization detector (PID), by creating indentions in the soil along the 2-foot section and collecting a reading directly from the soil core. Each 2-foot section was also screened for pH utilizing a soil pH probe. Following field screening the liner was re-sealed, prior to opening the next 4-foot section and repeating the field screening process. Once all soil cores were field screened, soil samples selected for laboratory analysis were transferred to clean, labeled sample containers (provided by the laboratory) and placed immediately on ice in a cooler for preservation in the field. Following field screening and sample selection, soil was lithologically classified and inspected in the field for evidence of contamination (odors, staining, etc.). The results of headspace analyses, lithological descriptions, and core retrieval times were recorded on boring logs. Soil samples were submitted to a certified laboratory for analysis.

Non-dedicated equipment utilized during soil boring activities was decontaminated before and after each use with non-phosphate detergent wash, followed by distilled water rinses to prevent cross-contamination.

HAND AUGER SOIL SAMPLING PROCEDURES

All sampling activities were performed in accordance with standard United States Environmental Protection Agency (U.S. EPA) protocols for environmental investigations by August Mack personnel.

Surface soil samples were collected using a hand auger to the desired depth required for the investigation. Soil samples were collected continuously from each sample location at half-foot intervals, beginning at grade level and continuing until the boring was terminated. Each soil sample was obtained using a stainless-steel core barrel sampler with a 6-foot extension attached to the end of a threaded cross handle. Soil samples were collected by turning the barrel sampler to the desired depth and recovering a continuous soil sample inside the barrel.

Upon retrieval, soil samples were extruded from the barrel by hand using clean nitrile sampling gloves to prevent cross-contamination between samples. All reusable equipment that was in contact with the samples was decontaminated before each use with a non-phosphate detergent (i.e. Liquinox® or equivalent) wash, followed by distilled water and deionized water rinses.

Soil samples collected during the project were placed on top of new polyethylene sheeting and the samples inspected in the field for evidence of contamination such as visible staining and/or odors. For each 1-foot section an aliquot of soil was transferred to clean, labeled sample containers (provided by the laboratory) and placed immediately back on ice in a cooler for preservation in the field. Soil samples were then delivered to a certified laboratory for analysis using chain-of-custody documentation.

Upon completion of the surface soil sampling activities, all sampling equipment was decontaminated as noted.

GEOPROBE® GRAB GROUNDWATER SAMPLING PROCEDURES

Grab Groundwater Sampling Activities

Upon completion of the Geoprobe® soil borings, a one (1)-inch diameter temporary polyvinyl chloride (PVC) with 10-feet of 0.010-inch machine slotted well screen, threaded to the appropriate length of PVC riser, was installed in the borehole. The slotted screen was installed to intersect the groundwater interface. Groundwater samples were collected from the temporary piezometer using a peristaltic pump with dedicated polyethylene tubing (or equivalent). The groundwater samples were transferred to clean, labeled sample containers (provided by the laboratory) and placed immediately on ice in a cooler for preservation in the field. Groundwater samples were submitted for laboratory analysis via analytical methods outlined in **Table 1**.

Site Restoration Activities

Upon completion of the field sampling activities, temporary piezometers were removed from the boreholes and the boreholes were abandoned by manually pouring soil cuttings and/or bentonite chips into the boreholes. Site restoration was completed by patching the surface materials complementary to pre-investigation conditions. Some locations were converted to permanent monitoring wells, in these instances the monitoring well installation procedures were followed after removing the one (1) inch PVC pipe.

FIELD FILTERING

Prior to collection of dissolved, field filtered water samples, a new 0.45-micron high-capacity groundwater filter was attached to the end of the sampling tubing or a new disposable syringe. Groundwater filters, tubing, and syringes were handled with new, clean nitrile sampling gloves to prevent cross-contamination between samples. Once tubing was attached, sample water was passed through the filter using one of two methods: pressure push or gravity feed.

Pressure was applied via a Geotech bladder pump, peristaltic pump, or new disposable syringe to push the water through the filter. Gravity feed involved the use of a Teflon-lined bailer, which was filled with groundwater and connected to the filter with Teflon lined tubing. The bailer was then held upright with the filter at the bottom over a sample container, and the water gradually flowed through the filter into the container via gravity.

Samples were collected in clean, labeled sample containers (provided by the laboratory) and placed immediately on ice in a cooler for preservation in the field. New, dedicated, tubing or syringes and field filters were used for each well and discarded after each use.

SURFACE WATER SAMPLING PROCEDURES

New, dedicated, syringes were utilized to collect surface water from applicable sampling locations. Syringes were handled with new, clean nitrile sampling gloves to prevent cross-contamination between samples. Samples were collected in syringes from the sampling locations and transferred to clean, labeled sample containers (provided by the laboratory), and placed immediately on ice in a cooler for preservation in the field.

MONITORING WELL INSTALLATION PROCEDURES

All drilling and well installations were performed in accordance with standard United States Environmental Protection Agency (U.S. EPA) protocols.

Upon completion of the Geoprobe® soil borings, the appropriate borings were converted into permanent monitoring wells using the hollow-stem auger. Each well consisted of 2-inch diameter PVC with 10 feet of 0.010-inch machine slotted well screen threaded to the appropriate length of PVC riser. The screen filter pack consisting of coarse washed filter sand (#5 sand) was installed via gravity pour around the well screen. A weighted measuring tape was used to ensure that bridging did not occur during installation of the filter pack. During installation, the augers were slowly removed as the annular space was filled with sand. This process was continued until the filter pack extended approximately 2-2.5-feet above the top of the well screen. The annular space was filled with hydrated bentonite chips, installed via gravity pour, to approximately 2-feet above the filter pack, creating a bentonite seal. Above the seal, the annular space was filled with bentonite chips to approximately 1-2.5-feet below ground level. The remaining annular space was then then filled with coarse washed filter sand (#5 sand) to approximately 2-inches below the top of the well casing.

Each well was finished by installing either a flush-mount or stick-up steel protective cover surrounded by a 2-foot by 2-foot concrete pad. The riser pipes were cut approximately3-inches below the opening of the protective cover and each well was completed with a locking well cap.

The monitoring wells were developed to produce water that is as free, as practicable, from sediment, drill cuttings, and drilling water via a submersible pump. Each well was developed until the water was deemed representative of groundwater. The wells were allowed to equilibrate prior to sampling. All drilling materials were decontaminated between each monitoring well location and prior to demobilization from the Site.

Decontamination procedures during well installation activities included pressure-washing augers that encountered soils with non-phosphate detergent wash, followed by distilled water rinses. The development pump was also decontaminated before and after each use with non-phosphate detergent wash, followed by distilled water rinses to prevent cross contamination.

MONITORING WELL WATER LEVEL MEASUREMENT

Water level measurements were collected from each monitoring well prior to groundwater sampling. After removing the well cap, sufficient time was allowed for the water level to equilibrate with the ambient air pressure.

Prior to water level measuring, the existing reference point on the well casing was determined. A water level indicator probe was slowly lowered into the well until the sound from the indicator was audible. The probe was then slowly pulled out a few inches and dropped back down at smaller increments until the water level could be determined to within 0.01-feet. The water level was measured based on an existing reference point on the well casing. Following groundwater sampling activities, the total depth of the well was measured and recorded to the nearest 0.01-feet by allowing the probe of the measuring tape to contact the base of the well. The water level indicator was decontaminated before and after each use with a non-phosphate detergent wash, followed by distilled water and deionized water (laboratory provided) rinses to prevent cross contamination.

EQUIPMENT DECONTAMINATION

Equipment that came into contact with the soil and/or groundwater was decontaminated before and after each use with non-phosphate detergent wash, followed by distilled water rinses, and a deionized water rinse (laboratory provided) to prevent cross-contamination. All decontamination water generated during the sampling activities was containerized in properly labeled 55-gallon drums and stored on-Site pending disposal.

Job Narrative
240-208329-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 7/25/2024 10:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.1°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

General Chemistry

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
HF	Parameter with a holding time of 15 minutes. Test performed by laboratory at client's request. Sample was analyzed outside of hold time.
U	Indicates the analyte was analyzed for but not detected.

Job Narrative
240-209203-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 8/9/2024 10:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 3.4°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
240-212351-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 10/3/2024 12:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 5.6°C.

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) analyzed in batch 240-629629 was outside the method criteria for the following analyte(s): Bromomethane. An MRL standard at or below the reporting limit (RL) was analyzed with the affected samplesTB-1-20241003 (240-212351-8), (240-212367-C-1), (240-212367-A-1 MS) and (240-212367-B-1 MSD) and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D: The method blank for analytical batch 240-629629 contained Bromomethane above the method detection limit (MDL). Associated samples were not re-analyzed because the method blank results were less than the reporting limit (RL) OR practical quantitation limit (PQL).

Method 8260D: The continuing calibration verification (CCV) analyzed in batch 240-629507 was outside the method criteria for the following analyte(s): Bromoform and Bromomethane. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270E: The continuing calibration verification (CCV) associated with batch 240-629877 recovered above the upper control limit for Hexachlorocyclopentadiene. The sample associated with this CCV was non-detect for the affected analyte; therefore, the data has been reported. The associated sample is impacted: TO-E-0.0 (240-212351-1).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

PCBs
Method 8082A: Internal standard (ISTD) response for the following sample exceeded the control limit on Column CLP-2 0.53mm ID: TO-E-2.0 (240-212351-2). As such, the sample results associated with this ISTD were reported from the other column, which met ISTD acceptance criteria.

Method 8082A: The following samples required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: T125-E-0.0 (240-212351-5) and TO-W-2.0 (240-212351-7).

Method 8082A: The DCB Decachlorobiphenyl surrogate recovery for the following samples was outside acceptance limits (low biased) on the primary column: T125-E-0.0 (240-212351-5). The recovery is within acceptance limits on the other column, indicating that the extraction process was in control.

Method 8082A: The following samples required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: TO-C-0.0 (240-212351-3) and TO-W-0.0 (240-212351-4).

Method 8082A: The following samples appear to contain polychlorinated biphenyls (PCBs); however, due to weathering, other

environmental processes and/or contributions from the presence of multiple Aroclors, resulting in overlapping PCB patterns, the PCBs in the samples do not directly match any of the laboratory's Aroclor standards used for instrument calibration: TO-C-0.0 (240-212351-3) and TO-W-0.0 (240-212351-4). The samples have been quantified and reported using the best overall Aroclor/standard pattern match relative to the reference standards.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 6010D: The following sample was diluted due to the nature of the sample matrix: T125-E-0.0 (240-212351-5). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 9012B: The method blank for preparation batch 240-629525 and analytical batch 240-629607 contained Total Cyanide above the method detection limit (MDL) reporting limit (RL). Associated sample(s) were not re-extracted and/or re-analyzed because results were greater than 10X the value found in the method blank.

Method 9012B: The method blank for preparation batch 240-629525 contained total cyanide above the reporting limit (RL). None of the samples associated with this method blank contained the target compound; therefore, re-extraction and/or re-analysis of samples were not performed.

Method 9012B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 240-629719 and analytical batch 240-629821 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 9012B: The following sample was diluted due to the nature of the sample matrix: TO-W-2.0 (240-212351-7). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
240-212357-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 10/3/2024 12:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 5.8°C.

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) analyzed in batch 240-629629 was outside the method criteria for the following analyte(s): Bromomethane. An MRL standard at or below the reporting limit (RL) was analyzed with the affected samplesTB-2-20241003 (240-212357-16), (240-212367-C-1), (240-212367-A-1 MS) and (240-212367-B-1 MSD) and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D: The method blank for analytical batch 240-629629 contained Bromomethane above the method detection limit (MDL). Associated samples were not re-analyzed because the method blank results were less than the reporting limit (RL) OR practical quantitation limit (PQL).

Method 8260D: The continuing calibration verification (CCV) associated with batch 240-629575 recovered above the upper control limit for Carbon disulfide and Trichlorofluoromethane. The samples associated with this CCV were below the reporting limit for the affected analytes; therefore, the data have been reported. The associated samples are impacted: DUP-1-20241003 (240-212357-9), T625-W-0.0 (240-212357-10), T625-C-0.0 (240-212357-11), T750-E-0.0 (240-212357-12), T750-W-0.0 (240-212357-13), DUP-2-20241003 (240-212357-15), (CCV 240-629575/4), (CCVIS 240-629575/3), (LCS 240-629575/5), (LCS 240-629575/6), (MB 240-629575/9), (240-212357-B-15-C MS) and (240-212357-B-15-D MSD).

Method 8260D: The continuing calibration verification (CCV) analyzed in batch 240-629507 was outside the method criteria for the following analyte(s): Bromoform and Bromomethane. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270E: The following samples were diluted due to the nature of the sample matrix: T125-C-0.0 (240-212357-1), T250-E-0.0 (240-212357-2) and T625-C-0.0 (240-212357-11). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

PCBs
Method 8082A: The following samples required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: T250-E-0.0 (240-212357-2), T250-W-0.0 (240-212357-3), T250-C-0.0 (240-212357-4), T375-E-0.0 (240-212357-5), T500-E-0.0 (240-212357-7) and T500-W-0.0 (240-212357-8).

Method 8082A: The following samples appears to contain polychlorinated biphenyls (PCBs); however, due to the contributions of patterns from the presence of multiple Aroclors present the PCBs in the samples do not directly match any of the laboratory's Aroclor standards used for instrument calibration: T250-E-0.0 (240-212357-2), T625-W-0.0 (240-212357-10) and T750-W-0.0 (240-212357-13). The samples have been quantified and reported using the best overall Aroclor standard pattern match

Method 8082A: The following sample required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: T375-W-0.0 (240-212357-6).

Method 8082A: The following samples appear to contain polychlorinated biphenyls (PCBs); however, due to weathering, other environmental processes and/or contributions from the presence of multiple Aroclors, resulting in overlapping PCB patterns, the PCBs in the samples do not directly match any of the laboratory's Aroclor standards used for instrument calibration: T375-W-0.0 (240-212357-6). The samples have been quantified and reported using the best overall Aroclor/standard pattern match relative to the reference standards.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 9012B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 240-629719 and analytical batch 240-629821 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
240-212437-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 10/4/2024 4:30 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.1°C and 2.5°C.

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 240-629641 recovered above the upper control limit for 1,1,2-Trichloro-1,2,2-trifluoroethane and Carbon disulfide. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: TB3-20241003 (240-212437-11) and TB4-20241004 (240-212437-17).

Method 8260D: The continuing calibration verification (CCV) analyzed in batch 240-629641 was outside the method criteria for the following analyte(s): Dichlorodifluoromethane and Vinyl chloride. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.TB3-20241003 (240-212437-11) and TB4-20241004 (240-212437-17)

Method 8260D: Surrogate recovery for the following samples were outside the upper control limit: TB3-20241003 (240-212437-11) and TB4-20241004 (240-212437-17). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method 8260D: Batch will not be reported with MS/MSD as parent sample was above calibration limits

Method 8260D: The continuing calibration verification (CCV) associated with batch 240-629628 recovered above the upper control limit for Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: A MS/MSD was prepared for batch 240-629628, but was not analyzed due to an instrument malfunction. An acceptable LCS was analyzed and reported. No further corrective action was taken.

T875-W-0.0 (240-212437-1), T875-E-0.0 (240-212437-2), T875-C-0.0 (240-212437-3), T1000-W-0.0 (240-212437-4), T1000-E-0.0 (240-212437-5), T1000-C-0.0 (240-212437-6), T1125-W-0.0 (240-212437-7), T1125-E-0.0 (240-212437-8), T1125-C-0.0 (240-212437-9), DUP3-20241003 (240-212437-10), T125-E-2.0 (240-212437-12) and T125-W-2.0 (240-212437-13)

Method 8260D: The continuing calibration verification (CCV) associated with batch 240-629668 recovered above the upper control limit for Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270E: The continuing calibration verification (CCV) associated with batch 240-629877 recovered above the upper control limit for Hexachlorocyclopentadiene. The sample(s) associated with this CCV were non-detect for the affected analyte; therefore, the data have been reported. The associated samples are impacted: T875-W-0.0 (240-212437-1), T875-E-0.0 (240-212437-2), T875-C-0.0 (240-212437-3), T1000-W-0.0 (240-212437-4), T1000-E-0.0 (240-212437-5), T1000-C-0.0 (240-212437-6), T1125-W-0.0 (240-212437-7), T1125-E-0.0 (240-212437-8), T1125-C-0.0 (240-212437-9), DUP3-20241003 (240-212437-10), T125-E-2.0

(240-212437-12), T125-W-2.0 (240-212437-13), T250-E-2.0 (240-212437-14), T250-W-2.0 (240-212437-15) and T250-W-4.0 (240-212437-16).

Method 8270E: Six surrogates are used for this analysis. The laboratory's SOP allows one acid and one base of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: DUP3-20241003 (240-212437-10). These results have been reported and qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

PCBs
Method 8082A: The following samples required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: T125-E-2.0 (240-212437-12), T125-W-2.0 (240-212437-13), T250-E-2.0 (240-212437-14), T250-W-2.0 (240-212437-15), T250-W-4.0 (240-212437-16), (240-212512-B-1-A), (240-212512-B-1-B MS) and (240-212512-B-1-C MSD).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 6010D: The following sample was diluted due to the nature of the sample matrix: T1000-E-0.0 (240-212437-5). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

Job Narrative
240-212437-2

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 10/4/2024 4:30 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.1°C and 2.5°C.

General Chemistry
Method 7196A: The following samples were diluted due to the nature of the sample matrix: T875-W-0.0 (240-212437-1) and (240-212357-G-14-C DU). Elevated reporting limits (RLs) are provided.

Method 7196A: The following samples were diluted due to the nature of the sample matrix: T1000-E-0.0 (240-212437-5), T1125-C-0.0 (240-212437-9) and DUP3-20241003 (240-212437-10). Elevated reporting limits (RLs) are provided.

Method 7196A: The matrix spike soluble (MSS) recovery for preparation batch 410-560807 and analytical batch 410-561397, were outside control limits due to sample matrix. The associated laboratory control sample (LCSS/LCSI) recoveries met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
240-212351-2

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 10/3/2024 12:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 5.6°C.

General Chemistry
Method 7196A: The matrix spike soluble (MS) recovery for the batch, was outside control limits due to sample matrix. The associated laboratory control sample (LCSS/LCSI) recoveries met acceptance criteria.

Method 7196A: The following samples were diluted due to the nature of the sample matrix: TO-E-0.0 (240-212351-1), TO-W-0.0 (240-212351-4), T125-E-0.0 (240-212351-5) and T125-W-0.0 (240-212351-6). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
240-212357-2

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

The samples were received on 10/3/2024 12:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 5.8°C.

General Chemistry
Method 7196A: The following samples were diluted due to the nature of the sample matrix: T125-C-0.0 (240-212357-1), T250-E-0.0 (240-212357-2), T250-W-0.0 (240-212357-3), T250-C-0.0 (240-212357-4), T375-E-0.0 (240-212357-5), T375-W-0.0 (240-212357-6), T500-E-0.0 (240-212357-7), T500-W-0.0 (240-212357-8), DUP-1-20241003 (240-212357-9), T625-W-0.0 (240-212357-10), T625-C-0.0 (240-212357-11), T750-E-0.0 (240-212357-12), T750-W-0.0 (240-212357-13), T625-E-0.0 (240-212357-14), DUP-2-20241003 (240-212357-15) and (240-212357-G-14-C DU). Elevated reporting limits (RLs) are provided.

Method 7196A: The matrix spike soluble (MSS) recovery for preparation batch 410-560807 and analytical batch 410-561397, were outside control limits due to sample matrix. The associated laboratory control sample (LCSS/LCSI) recoveries met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
240-212555-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 10/7/2024 1:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.6°C and 5.3°C.

GC/MS VOA
Method 8260D: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: T500-C-SW (240-212555-2). Elevated reporting limits (RLs) are provided.

Method 8260D: The following sample(s) was collected in a properly preserved vial; however, the pH was outside the required criteria when verified by the laboratory. The sample was analyzed within the 7-day holding time specified for unpreserved samples: T500-C-SW (240-212555-2).

Method 8260D: The continuing calibration verification (CCV) analyzed in batch 240-630020 was outside the method criteria for the following analyte(s): Carbon disulfide. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270E: Several surrogate recoveries for the following sample were outside control limits: T500-C-SW (240-212555-2). Re-extraction and re-analysis was performed and surrogate recoveries were again outside control limits demonstrating matrix interference. The initial results have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

PCBs
Method 8082A: An incorrect volume of spiking solution was inadvertently added to the laboratory control sample (LCS) associated with preparation batch 240-629884 and analytical batch 240-630002. Percent recoveries are based on the amount spiked.

Method 8082A: Surrogate recovery for the following sample was outside control limits: T500-C-SW (240-212555-2). Re-extraction and/or re-analysis was performed and surrogate recovery was outside control limits. The original data has been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 6010D - Total Recoverable: The following sample was diluted due to the nature of the sample matrix: T500-C-SW (240-212555-2). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 7196A: The following sample was diluted due to the nature of the sample matrix: T500-C-SW (240-212555-2). Elevated reporting limits (RLs) are provided.

Method 9012B: The following sample was diluted due to the nature of the sample matrix: RB-1-20241007 (240-212555-1). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
240-212566-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 240-629852 recovered above the upper control limit for Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The continuing calibration verification (CCV) analyzed in batch 240-629852 was outside the method criteria for the following analyte(s): Chloroethane. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D: The continuing calibration verification (CCV) analyzed in batch 240-629818 was outside the method criteria for the following analyte(s): Bromomethane. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Method 8082A: The Decachlorobiphenyl surrogate in the continuing calibration verification (CCV) associated with analytical batch 240-630039 failed criteria. The Aroclors in the opening CCVs passed criteria and all the samples passed surrogate. After careful evaluation the data is reported.

Method 8082A: The following samples required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: DUP-5-20241005 (240-212566-22), T1125-E-4.0 (240-212566-24), T1125-W-2.0 (240-212566-25), T1125-W-2.0 (240-212566-25[MS]), T1125-W-2.0 (240-212566-25[MSD]) and DUP7-20241005 (240-212566-32).

Method 8082A: The method blank for preparation batch 240-629921 contained Aroclor-1242 above the reporting limit (RL). None of the samples associated with this method blank contained the target compound; therefore, re-extraction and/or re-analysis of samples were not performed.

Method 8082A: The Decachlorobiphenyl surrogate in the continuing calibration verification (CCV) associated with analytical batch 240-630188 failed criteria. The Aroclors in the opening CCVs passed criteria and all the samples passed surrogate. After careful evaluation the data is reported.

Method 8082A: The following samples required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: T1125-E-2.0 (240-212566-23), T375-W-2.0 (240-212566-28), T375-W-4.0 (240-212566-29), T375-E-2.0 (240-212566-30), T375-E-4.0 (240-212566-31) and DUP4-20241004 (240-212566-33).

Method 8082A: The following samples appear to contain polychlorinated biphenyls (PCBs); however, due to weathering, other environmental processes and/or contributions from the presence of multiple Aroclors, resulting in overlapping PCB patterns, the PCBs in the samples do not directly match any of the laboratory's Aroclor standards used for instrument calibration: T375-W-2.0 (240-212566-28), T375-W-4.0 (240-212566-29), T375-E-2.0 (240-212566-30), T375-E-4.0 (240-212566-31) and DUP4-20241004 (240-212566-33). The samples have been quantified and reported using the best overall Aroclor/standard pattern match relative to the reference standards.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

E-2.0 (240-212566-30) and T375-E-4.0 (240-212566-31). Elevated reporting limits (RLs) are provided.

Method 9012B: The following sample was diluted due to the nature of the sample matrix: DUP7-20241005 (240-212566-32). Elevated reporting limits (RLs) are provided.

Method 9012B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 240-630252 and 240-630310 and analytical batch 240-630539 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.
